I. INTRODUCTION

Amador County (County), in cooperation with the City of Plymouth (City), proposes to improve the intersection of Shenandoah Road and Fiddletown Road. As required by the California Environmental Quality Act (CEQA) (California Public Resources Code (PRC) Sections 21000, et seq.), the County has prepared this Initial Study/Mitigated Negative Declaration (IS/MND) to determine whether the project may have a significant effect on the environment.

1. LEGAL AUTHORITY AND FINDINGS

The County has prepared this IS/MND in accordance with the Guidelines for the Implementation of CEQA (CEQA Guidelines) (California Code of Regulations (CCR), Title 14, Chapter 3, Sections 15000, et seq.). Although consultants assisted in the preparation of this IS/MND, all analysis, conclusions, findings, and determinations presented in the IS/MND represent the findings of the County, acting as the Lead Agency under CEQA. In accordance with the provisions of CEQA and the state and local CEQA Guidelines, as the Lead Agency, the County is responsible for reviewing the potential environmental effects, and after consideration, approving or denying the project.

The City of Plymouth is a Responsible Agency under CEQA. As identified in Section 1050(b) of the CEQA Guidelines, “...the decision-making body of each responsible agency shall consider the lead agency’s EIR or negative declaration prior to acting upon or approving a project. Each responsible agency shall certify that its decision-making body reviewed and considered the information contained in the EIR or negative declaration on the project."

2. DOCUMENT PURPOSE

Section 15063(c) of the CEQA Guidelines defines an IS as the proper preliminary method of analyzing the potential environmental consequences of a project. The purposes of an IS are:

- To provide the Lead Agency with the necessary information to decide whether to prepare an Environmental Impact Report (EIR), an MND, or a Negative Declaration (ND);

- To enable the Lead Agency to modify a project and mitigate adverse impacts, thus avoiding the need to prepare an EIR; and

- To provide sufficient technical analysis of the environmental effects of a project to permit a judgment based on the record as a whole, that the environmental effects of a project have been adequately mitigated.

3. DOCUMENT ORGANIZATION

Section I - Introduction: Describes the CEQA context and purpose of an IS.

Section II - Project Description: Provides background information on the Lead Agency (County) and describes the project, in response to the CEQA Environmental Checklist.
Section III - Environmental Factors Potentially Affected: Identifies Potentially Significant Impacts, which are later explained in Section V.

Section IV – Determination: Presents the determination regarding the appropriate environmental document for the project.

Section V – Evaluation of Environmental Impacts: Provides discussions of the possible environmental impacts of the project for specific issue areas that have been identified in the CEQA Environmental Checklist. For each issue area, potential effects are discussed and evaluated.

4. TERMINOLOGY

A “significant effect” is defined by Section 15382 of the CEQA Guidelines as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by a project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance.” According to Section 15358 of the CEQA Guidelines, “an economic or social change by itself shall not be considered a significant effect on the environment, but may be considered in determining whether the physical change is significant.”
II. ENVIRONMENTAL CHECKLIST

1. Project Title:
Shenandoah Road/Fiddletown Road Intersection Improvement Project

2. Lead Agency Name and Address
Amador County
Department of Transportation and Public Works
810 Court Street
Jackson, CA 95642

3. Contact Person and Phone Number
Jered Reinking, Senior Civil Engineer

4. Project Location
Intersection of Shenandoah Road and Fiddletown Road, Amador County, California

5. Project Proponent’s Name and Address
Amador County
Department of Transportation and Public Works
810 Court Street
Jackson, CA 95642

6. General Plan Designation
County right of way (ROW) and Agricultural General

7. Zoning
County ROW and AG (Exclusive Agriculture)
8. Project Description

The County, in cooperation with the City, proposes to realign the intersection of Shenandoah Road and Fiddletown Road (project). The project is located just northeast of the city of Plymouth, in Amador County, California (see Figure 1, Project Vicinity Map and Figure 2, Project Location Map). The project would utilize federal Highway Safety Improvement Program (HSIP) program funding and local funding sources.

The purpose of the project is to improve intersection safety and roadway geometrics by improving intersection visibility, maximizing sight distance through the project area, improving horizontal and vertical alignments, enhancing signage and pavement delineation, and installing traffic control improvements at the intersection. During the 5-year period between January 2007 and December 2011, there were 14 collisions at the Shenandoah Road/Fiddletown Road intersection, including one that resulted in a fatality. Collisions at the intersection are primarily related to poor roadway geometry, resulting in driver confusion.

Additionally, this intersection was identified as an intersection of high public concern for safety during public outreach efforts conducted by the City for a nearby intersection improvement project, as well as during cooperative public outreach efforts made by the City and County for this project.

Shenandoah Road traverses north to south through the project area, then curves west of the intersection and traverses east to west; Fiddletown Road extends east to west, east of the intersection (see Figure 3, Project Area Map). The project area primarily includes open grass lands with scattered clusters of oak trees. There are vineyards and agricultural facilities adjacent to the project area, south of Fiddletown Road. Shenandoah Valley Charter School/Amador Community School is approximately 500 feet west of the project area, at 10010 Shenandoah Road. The City of Plymouth water storage tank is located immediately east of the project area, south of Fiddletown Road.

The project would include the realignment of the existing intersection as a “T” intersection with a stop sign control on Fiddletown Road (see Figure 4, Preliminary Plans). The project would include shifting the Shenandoah Road alignment to the northwest, and constructing a new leg of Fiddletown Road to intersect with Shenandoah Road. The horizontal length of the new leg would be maximized to improve the approach roadway and intersection geometrics. Travel along Shenandoah Road would remain free flowing, while Fiddletown Road would be stop controlled at the intersection. Shenandoah Road would have a dedicated left-turn pocket at the intersection. A streetlight may be installed at the intersection to improve intersection visibility and safety. The vertical alignment of Shenandoah Road would be adjusted to raise the profile to accommodate acceptable intersection approach grading for the new leg of Fiddletown Road. A driveway would also be provided to the south for the Sutter Home Winery parcel to access the realigned Shenandoah Road.
FIGURE 1. PROJECT VICINITY MAP
Shenandoah-Fiddletown Roads Intersection Improvement Project

Shenandoah-Fiddletown Roads Intersection Improvement Project
FIGURE 3. PROJECT AREA MAP
Shenandoah-Fiddletown Roads Intersection Improvement Project
FIGURE 4. PRELIMINARY PLANS
Shenandoah-Fiddletown Roads Intersection Improvement Project

Source: Amador County, 2015
Due to the topography of the project area, construction of the roadway would require over-excavation of areas surrounding the proposed roadway alignment in order to supply sufficient amounts of soil for the new roadbed. Areas of over-excavation would be located within County ROW, and would be between five feet and 25 feet deep.

Construction is anticipated to require six months to complete. Construction would require the acquisition of ROW and vegetation/tree removal. Prior to completion of construction, all areas disturbed by construction would be suitably re-graded, stabilized and hydroseeded with appropriate grasses.

9. Surrounding Land Uses and Setting

The project is located in unincorporated Amador County, just northeast of the city of Plymouth, approximately 20 miles north of the city of Jackson, and 60 miles east of the city of Sacramento. The project is located in the western foothills of the Sierra Nevada mountain range, which runs for approximately 400 miles in a north-south direction on the border of California and Nevada.

Shenandoah Road traverses north to south through the project area, then curves west of the intersection and traverses east to west; Fiddletown Road extends east to west, east of the intersection (see Figure 3, Project Area Map). The project area primarily includes open grass lands with oak trees. There are vineyards and agricultural facilities adjacent to the project area, south of Fiddletown Road. Shenandoah Valley Charter School/Amador Community School is approximately 500 feet west of the project area, at 10010 Shenandoah Road. There are no residences near the project area, and the closest home is located approximately 1,500 feet east of the project area, south of Fiddletown Road. The City of Plymouth water storage tank is located immediately east of the project area on the south side of Fiddletown Road.

10. Other Public Agencies Whose Approval is Required

- County: Various construction, grading, and encroachment permits
- City: Encroachment permit
- California Department of Transportation (Caltrans): Encroachment permit (for construction area signage on State Route 49)
### III. ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by the project, involving at least one impact that is a “Potentially Significant Impact” or a “Potentially Significant Unless Mitigation is Incorporated” as indicated by the checklist on the following pages.

IV. DETERMINATION

On the basis of this initial evaluation:

☐ I find that the project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the project MAY have a “potentially significant impact” or “potentially significant unless mitigated” impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

V. EVALUATION OF ENVIRONMENTAL IMPACTS

Potential environmental effects of the project are classified and described within the CEQA Environmental Checklist under the following general headings:

“No Impact” applies where the project would not result in an impact in a category.

“Less Than Significant Impact” applies where the project would result in an impact, but the magnitude of the impact is considered insignificant or negligible.

“Potentially Significant Unless Mitigation Incorporated” applies where the incorporation of mitigation measures has reduced an impact from a “Potentially Significant Impact” to a “Less Than Significant Impact.”

“Potentially Significant Impact” applies where the project has the potential to result in a significant and unmitigable environmental impact.
1. AESTHETICS

REGULATORY SETTING

The County’s General Plan identifies the following policy related to aesthetics (Amador County, 1967):

- To give careful consideration to the protection of natural scenic resources and environmental assets in all future major public and private development planning.

AFFECTED ENVIRONMENT

The project area is surrounded mostly by open grasslands with scattered oak trees. The topography consists of rolling foothills, with the project area sloping from the highest point at the north end of Shenandoah Road, to the lowest point at the west end of Shenandoah Road.

Photographs of the project area are shown in Figure 5, Existing Views. There are agricultural lands (vineyards) adjacent to the project area, south of Shenandoah Road (see Figure 5, Existing Views, View 1). The City of Plymouth water storage tank is located southeast of the project area on a hilltop south of Fiddletown Road. The view of the water storage tank is mostly shielded from roadway views by topography and dense vegetation consisting of small trees and shrubs (see Figure 5, Existing Views, View 2). The northwest portion of the project area consists of a hill sloping upwards to the northwest from the roadway (see View 3, Existing Views, Figure 5). This area is used primarily as grazing land and consists of grass lands with scattered medium and large oak trees. The northeast portion of the project area consists of a hill sloping upward to the north (see Figure 5, Existing Views, View 4). This area is used primarily as grazing land and consists of grass lands with scattered medium and large oak trees and a large pine tree. Utility poles and overhead lines are present along the roadway corridor.

PROJECT IMPACTS

Would the project:

a) Have a substantial adverse effect on a scenic vista?

☐ Potentially Significant Impact ☐ Less Than Significant with Mitigation ☒ Less Than Significant Impact ☐ No Impact

Discussion a): A scenic vista is a viewpoint that provides expansive views of a highly valued landscape for the benefit of the general public. A substantial adverse effect on a scenic vista is one that would degrade the view from a designated scenic view spot.
FIGURE 5. EXISTING VIEWS

View 1: Vineyard South of Shenandoah Road (view from eastbound Shenandoah Road approaching intersection)

View 2: Eastern Limit of Project Area (view from westbound Shenandoah Road approaching intersection)
View 3: Northwest Portion of Project Area (view from eastbound Shenandoah Road approaching intersection)

View 4: Northern Portion of Project Area (view from southbound Shenandoah Road approaching intersection)
While the rolling hills and trees in the project area provide an attractive landscape for motorists passing through the project area, the project area does not meet the definition of a scenic vista. The project would include realigning the intersection of Shenandoah Road and Fiddletown Road and its roadway approaches to the northwest of its existing location, and would not include any vertical elements that would block or otherwise distort views of the surrounding area; therefore, impacts would be less than significant.

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

- Potentially Significant Impact
- Less Than Significant with Mitigation
- Less Than Significant Impact
- No Impact

**Discussion b):** According to the California Scenic Highway Mapping System, all of State Route 49 within Amador County and State Route 88 from the city of Jackson to the Dew Drop Ranger are designated as “Eligible State Scenic Highways – Not Officially Designated.” The project area is located approximately 0.33 mile away from State Route (SR) 49 at the closest point, and is not visible from the SR 49 corridor due to shielding from topography, vegetation, and urban development in the City of Plymouth. Because the project area is not located within a state scenic highway, and is not visible from a state scenic highway, there would be no impact.

c) Substantially degrade the existing visual character or quality of the site and its surroundings?

- Potentially Significant Impact
- Less Than Significant with Mitigation
- Less Than Significant Impact
- No Impact

**Discussion c):** The project would include realigning the intersection of Shenandoah Road and Fiddletown Road and its roadway approaches to the northwest of its existing location, and would not include any vertical elements that would block or otherwise distort views of the surrounding areas. Vegetation and tree removal would be required to accommodate the intersection and roadway approaches realignment, which could result in a change in the visual setting of the project area; however, tree and vegetation removal would be reduced to the extent feasible to minimize visual changes, and the aesthetics of the project area would be similar to existing conditions following construction of the project. The project design would be compatible with the existing visual character and quality of the area. Therefore, impacts would be less than significant.

During construction of the project, there could be temporary visual impacts associated with vegetation removal and onsite storage of construction materials and debris; however, these
impacts would be temporary, and following construction, temporarily disturbed areas would be restored to pre-project conditions. Therefore, impacts would be less than significant.

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

☐ Potentially Significant Impact  ☐ Less Than Significant with Mitigation  ☒ Less Than Significant Impact  ☐ No Impact

Discussion d): Existing light or glare in the project area from vehicles traveling on the roadway would remain during project construction and operation, and there would be no change from these existing conditions after the project is implemented.

There are no existing streetlights the project area. The project may install a streetlight at the intersection to improve intersection visibility and safety. The streetlight would comply with standard American Association of State Highway and Transportation Officials (AASHTO) and Caltrans specifications for intersection lighting. The streetlight would be directed downward to minimize “overspill” lighting outside of the intersection or into the night sky; would not consist of mercury vapor, low-pressure sodium, or fluorescent bulbs; not be of unusually high intensity or brightness; nor would it blink or flash. The project would not create substantial new sources of light or glare that would adversely affect day or nighttime views in the area. Therefore, there would be a less than significant impact.

2. AGRICULTURE AND FORESTRY RESOURCES

REGULATORY SETTING

State Regulations

The California Land Conservation Act of 1965, commonly referred to as the Williamson Act, enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agricultural or related open space use. In return, landowners receive property tax assessments that are much lower than normal because they are based upon farming and open space uses as opposed to full market value (CDOC, 2015). The intent of the Williamson Act is to encourage voluntary land conservation, particularly conservation of agricultural land in California.

Local Regulations

The County’s General Plan identifies the following policy related to agriculture (Amador County, 1967):

- To provide all reasonable protection and encouragement to the preservation of agricultural soils and continued agricultural use of suitable soils.
**Affected Environment**

While there are trees in the project area, the tree coverage is not substantial enough to qualify as a forest, which generally includes at least 10 percent tree coverage. In addition, none of the trees in the project area are harvested as forestry resources; therefore, there are no forestry resources within or near the project area.

According to the County’s 2012 Important Farmland Map issued by the California Department of Conservation (CDOC), there is Unique Farmland south of the project area in the vineyard south of Shenandoah Road. The remainder of the land in and around the project area is identified as Grazing Land or Other Land (CDOC, 2014). There is no Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance in or near the project area (see Figure 6, Important Farmland Map).

The land surrounding the project area is zoned AG (Exclusive Agricultural District) on the County’s Zoning Map. The parcel in the northwest portion of the project area (Assessor’s Parcel Number [APN] 008-0030-016) is under protection of a Williamson Act contract.

**Project Impacts**

Would the project:

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program (FMMP) of the California Resources Agency, to non-agricultural use?

- [ ] Potentially Significant Impact  -  [ ] Less Than Significant with Mitigation  -  [ ] Less Than Significant Impact  -  [x] No Impact

Discussion a): As shown on the County’s 2012 Important Farmland Map, the project area does not include any Prime Farmland or Farmland of Statewide Importance. There is Unique farmland to the south of the project area in the vineyard south of Shenandoah Road; however, this area would not be impacted by the project because the project would not require ROW acquisition form this area, and would not encroach upon this area or otherwise cause indirect conversion of the land. Therefore, there would be no impact.

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

- [ ] Potentially Significant Impact  -  [ ] Less Than Significant with Mitigation  -  [x] Less Than Significant Impact  -  [ ] No Impact
Discussion b): One parcel (APN 008-030-016) in the northwest portion of the project area is enrolled in a Williamson Act contract. The parcel is approximately 117 acres in size, and is used primarily for cattle grazing. The project would require acquisition of approximately five acres of land from this parcel. An additional small area may be required for a temporary construction easement (TCE) during construction; however, following construction, the land required for the TCE would be largely restored to pre-project conditions.
FIGURE 6: IMPORTANT FARMLAND MAP
Shenandoah-Fiddletown Roads Intersection Improvement Project
Section 51295 of the California Government Code says:

When an action to condemn or acquire less than all of a parcel of land subject to a [Williamson Act] contract is commenced, the contract shall be deemed null and void as to the land actually condemned or acquired and shall be disregarded in the valuation process only as to the land actually being taken, unless the remaining land subject to contract will be adversely affected by the condemnation, in which case the value of that damage shall be computed without regard to the contract (California Government Code, 2015).

Only the portion of the parcel under Williamson Act protection that would be acquired to accommodate the project (approximately five acres) would be removed from Williamson Act contract protection, and the remainder of the parcel (approximately 112 acres) would remain under contract protection.

The portion of the parcel required for ROW acquisition is located adjacent to Shenandoah Road, and the entire parcel is currently available for use for agricultural (grazing) purposes. Compared to the total acreage of the parcel (117 acres), the amount of land required for ROW (approximately five acres) would not be substantial (approximately 4.3 percent of the total parcel acreage). After project implementation, the remaining portion of the parcel (approximately 112 acres) would still be available for agricultural use, and no additional acreage would be indirectly affected. In addition, implementation of the project would not conflict with farming activities or uses on surrounding farmland, and would not result in an indirect conversion of neighboring farmland as a result of incompatibility. Because only five acres of the parcel under Williamson Act contract would be acquired for the project, the remaining 112 acres of the parcel would remain under contract protection under Section 51295 of the California Government Code. Implementation of the project would not conflict with farming activities on remaining land or result in indirect conversion of remaining land. Therefore, the project would not conflict with the Williamson Act contract in place for the remainder of the parcel, and impacts would be less than significant.

The project area is zoned as County ROW and AG (Exclusive Agriculture District). Approximately five acres of land zoned as AG would be required as permanent ROW for the realigned intersection and roadway approaches. Because the agricultural land required for the project is adjacent to Shenandoah Road, only a small portion of the parcel that lies along the roadway frontage would be converted to non-agricultural use. The proposed use as a roadway would not be incompatible with the existing use of the remainder of the agricultural land or adjacent agricultural uses. In addition, compared to the total acreage of the parcel (117 acres), the amount of land zoned as AG required for the project (approximately five acres) would not be substantial (approximately 4.3 percent of the total parcel acreages). With project implementation, the remaining land on the parcel would still be available for agricultural use,
and no additional acreage would be indirectly affected. Therefore, impacts would be less than significant.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

<table>
<thead>
<tr>
<th></th>
<th>Potentially Significant Impact</th>
<th>Less Than Significant with Mitigation</th>
<th>Less Than Significant Impact</th>
<th>No Impact</th>
</tr>
</thead>
</table>

Discussion c): The project area is an existing roadway and includes land zoned as AG (Exclusive Agricultural District). The project area is not zoned for forest land or timberland, and there are no forest or timber resources within or surrounding the project area. Therefore, there would be no impact.

d) Result in the loss of forest land or conversion of forest land to non-forest use?

<table>
<thead>
<tr>
<th></th>
<th>Potentially Significant Impact</th>
<th>Less Than Significant with Mitigation</th>
<th>Less Than Significant Impact</th>
<th>No Impact</th>
</tr>
</thead>
</table>

Discussion d): As stated in Discussion c) above, there is no forest land within or surrounding the project area. Therefore, there would be no impact.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

<table>
<thead>
<tr>
<th></th>
<th>Potentially Significant Impact</th>
<th>Less Than Significant with Mitigation</th>
<th>Less Than Significant Impact</th>
<th>No Impact</th>
</tr>
</thead>
</table>

Discussion e): As stated in Discussion c) above, there is no forest land within or surrounding the project area; therefore, there would be no impact from conversion of forest land.

As stated in Discussion b) above, because the agricultural land required for the project is adjacent to Shenandoah Road, only a small portion of the parcel that lies along the roadway frontage would be converted to non-agricultural use. The proposed use as a roadway would be compatible with the use of the remainder of the agricultural land or adjacent agricultural uses. In addition, compared to the total acreage of the parcels (117 acres), the amount of land zoned as AG required for the project (approximately five acres) would not be substantial.
(approximately 4.3 percent of the total parcel acreages). After project construction, the remaining land on the parcel would still be available for agricultural use, and no additional acreage would be indirectly affected. Therefore, the project would not result in other changes in the existing environment that could result in conversion of Farmland to non-agricultural use, and impacts would be less than significant.

3. AIR QUALITY

REGULATORY SETTING

Federal and State Regulations

The United States (U.S.) Environmental Protection Agency (U.S. EPA) is responsible for national and interstate air pollution issues and policies. The U.S. EPA sets national vehicle and stationary source emission standards, oversees approval of all State Implementation Plans (SIP), provides research and guidance for air pollution programs, and sets National Ambient Air Quality Standards (NAAQS) under the Federal Clean Air Act (FCAA) for criteria pollutants, which are ozone (O₃), particulate matter (PM₁₀), fine particulate matter (PM₂.₅), carbon monoxide (CO), nitrogen dioxide (NO₂), sulfur dioxide (SO₂), and lead.

A SIP is a document prepared by each state describing existing air quality conditions and measures that will be followed to attain and maintain federal standards. The SIP for the State of California is administered by the California Air Resources Board (CARB), which has overall responsibility for statewide air quality maintenance and air pollution prevention. California’s SIP incorporates individual federal attainment plans for regional air districts – these air districts prepare their federal attainment plans, which are sent to CARB to be approved and incorporated into the California SIP. Federal attainment plans include the technical foundation for understanding air quality (e.g., emission inventories and air quality monitoring), control measures and strategies, and enforcement mechanisms.

Under the California Clean Air Act (CCAA), CARB requires that each local air district prepare and maintain an air quality management plan to achieve compliance with California Ambient Air Quality Standards (CAAQS). These standards are generally more stringent and apply to more pollutants than the NAAQS (i.e., visibility reducing particulates, hydrogen sulfide, and sulfates).

CARB has also passed numerous regulations to reduce the public’s exposure to air emissions. For example, the In-Use Off-Road Diesel Vehicle Regulation includes enforceable elements, such as limits on vehicle idling to no more than five consecutive minutes, and equipment reporting and labeling.

Local Regulations

The project area is located in the Amador County Air Pollution Control District (Amador APCD,) which is responsible for air quality regulation in Amador County. The following Amador APCD rules and regulations are applicable to the proposed project:
**Rule 202 – Visible Emissions:** This rule prohibits the discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is:

a) As dark or darker in shade as that designated as No. 1 on the Ringlemann Chart, as published by the U.S. Bureau of Mines, or

b) Of such opacity as to obscure an observer's view to a degree equal to or greater than does smoke described in subsection (A) of this section.

**Rule 205 – Nuisance:** This rule prohibits the discharge from any source whatsoever such quantities of air contaminants or other material which can cause injury, detriment, nuisance, or annoyance to any considerable number of persons, or to the public, or which endanger the comfort, repose, health or safety of any such persons, or the public, or which cause to have a natural tendency to cause injury or damage to business or property.

**Rule 207 – Particulate Matter:** This rule prohibits the release or discharge into the atmosphere from any source or single processing unit, exclusive of sources emitting combustion contaminants only, particulate matter emissions in excess of 0.1 grains per cubic foot of dry exhaust gas at standard conditions.

**Rule 218 – Fugitive Dust Emissions:** The purpose of this rule is to prevent and control fugitive dust emissions to the atmosphere by using good housekeeping and/or work practices. This rule applies to activities including, but not limited to, public or private construction, grading and/or clearing of land.

**Affected Environment**

**Local Climate and Meteorological Conditions**

The project area is located in the Mountain Counties Air Basin, which includes the foothills and western slope of the Sierra Nevada Mountain Range. Summer conditions are typically characterized by high temperatures and low humidity. Summer temperatures, as measured at the Sutter Hill Ranger Station (the nearest weather monitoring station to Plymouth), average 90 degrees Fahrenheit and above, while nighttime temperatures average 60 degrees Fahrenheit and below. Winter conditions are characterized by occasional rainstorms and/or occasional snow, interspersed with stagnant and sometimes foggy weather. Wintertime high temperatures average over 50 degrees Fahrenheit, and winter low temperatures average in the high 30s. During winter, northerly winds become more frequent, but southerly winds predominate.

**Ambient Air Quality Attainment Status**

Amador County is currently designated as a nonattainment area for the state and federal O₃ standard. For all other criteria pollutants, the County is designated as either attainment and/or unclassified (an area that cannot be classified on the basis of available information).
**PROJECT IMPACTS**

Would the project:

a) **Conflict with or obstruct implementation of the applicable air quality plan?**

<table>
<thead>
<tr>
<th>Potentially Significant Impact</th>
<th>Less Than Significant Impact</th>
<th>Less Than Significant Impact with Mitigation</th>
<th>No Impact</th>
</tr>
</thead>
</table>

**Discussion a):** Because the project area includes the existing roadway and open grass lands, existing air emissions in the project area are primarily from vehicles traveling along the roadway. Operation of the project would not generate new stationary or mobile sources of emissions because the project would maintain the same number of through lanes (one in each direction) and would not increase capacity or result in additional vehicles on the roadway. Therefore, project operation would not generate additional emissions above existing conditions, and would therefore not conflict with or obstruct implementation of applicable air quality plans. Therefore, there would be no impact on implementation of applicable air quality plans as a result of operation of the project.

Construction of the project would generate temporary, short-term emissions of various air pollutants. Pollutant emissions would vary from day to day depending on the intensity and type of construction activity. The types of construction emissions that would most likely result from the project are fugitive dust emissions (PM\(_{10}\) and PM\(_{2.5}\)) and mobile source emissions from construction equipment, which primarily include oxides of nitrogen (NO\(_x\)), volatile organic compounds (VOC), CO, PM\(_{10}\), PM\(_{2.5}\), and diesel particulate matter (DPM). NO\(_x\) and VOCs are also called, O\(_3\) precursors, because they can lead to the formation of O\(_3\) in the presence of sunlight and heat.

Construction activities with the potential to result in fugitive dust emissions include excavation and other earth-moving activities that disturb dirt and result in the release of dust particles into the air. The project would require earth-moving activities involving over-excavation of areas surrounding the proposed roadway to a depth of five to 25 feet, as well as earth moving activities to prepare the new intersection and approach roadways.

Mobile source emissions result from pollution sources that move, such as vehicles, engines, and motorized equipment that produce exhaust and other emissions. The project would require several construction activities that have the potential to result in mobile source emissions, such as the use of construction equipment (bulldozers, trucks, and scrapers), truck delivery of construction materials, hauling of construction debris, and workers commuting to and from the project area. Mobile source emissions from construction equipment are highest during use of heavy-duty, diesel-fueled equipment.
CARB has passed numerous regulations to reduce the public’s exposure to DPM and NO\textsubscript{x} emissions. For example, the In-Use Off-Road Diesel Vehicle Regulation includes enforceable elements, such as limits on vehicle idling to no more than five consecutive minutes, and equipment reporting and labeling. Construction activities for the project would be required to comply with these regulations. Project construction would also be subject to Amador APCD rules and regulations, which include, but are not limited to:

- Rule 202 – Visible Emissions
- Rule 205 – Nuisance
- Rule 207 – Particulate Matter
- Rule 218 – Fugitive Dust Emissions

Project construction would be short-term and temporary (lasting approximately six months), and with implementation of standard measures in compliance with applicable regulations, the project’s potential impacts on implementation of applicable air quality plans would be substantially minimized. Therefore, impacts would be less than significant.

b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?

- [ ] Potentially Significant Impact
- [x] Less Than Significant with Mitigation
- [ ] Less Than Significant Impact
- [ ] No Impact

Discussion b): The air quality standards that would be applicable to the project include the NAAQS and CAAQS for criteria pollutant. In addition, soil and rocks in the project area may contain naturally occurring asbestos (NOA), which may be found in serpentine (a dark green mineral, sometimes spotted like a snake’s skin), and other volcanic rocks. NOA was previously identified and removed at the Amador County School Expansion facility, located adjacent to the southwestern portion of the project area. In addition, a map prepared by the CDOC shows that the project area is near an area that is likely to contain NOA (CDOC, 2000). When soil or rocks containing NOA are disturbed, asbestos may become released and become airborne.

Because asbestos is a known carcinogen (a substance that causes cancer), the U.S. EPA and CARB have identified asbestos to be a toxic air contaminant (TAC), which is an air pollutant that may cause or contribute to an increase in mortality or serious illness, or which may pose a hazard to human health. TACs are usually present only in very small quantities in the air, but due to their high toxicity, may pose a threat to public health even at very low concentrations; therefore, there is no threshold level below which adverse health impacts are not expected to result from TACs. Unlike criteria pollutants that have NAAQS and CAAQS, TACs do not have state or federal standards. However, pursuant to the FCAA Amendments of 1990, the U.S. EPA is
required to control TACs, also referred to as Hazardous Air Pollutants (HAP), and has set National Emission Standards for HAPs (NESHAP). NESHAPs are technology-based, source-specific regulations that limit allowable emissions of HAPs. The U.S. EPA has delegated the authority to enforce the NESHAPs for asbestos to CARB and the local air districts.

To enforce the NESHAPs for asbestos, CARB has developed an NOA Air Toxics Control Measure (ACTM) for Construction, Grading, Quarrying, and Surface Mining Operations (CCR, Title 17, Section 93105, effective November 19, 2002). The ACTM requires that road construction and maintenance operations use dust control measures for a specified set of emission sources, and prevent visible emissions crossing the project boundaries. Construction projects that will disturb more than one acre must prepare and obtain local air district approval of an asbestos dust mitigation plan. The local air district must also be notified before any work begins.

DPM has also been identified as a TAC, and is also considered a mobile source air toxic (MSAT), which is a subset of HAPs from mobile sources that are defined in the FCAA and federally regulated by the U.S. EPA. At the state level, CARB has passed numerous regulations to reduce the public’s exposure to DPM and other mobile source emissions. For example, the In-Use Off-Road Diesel Vehicle Regulation includes enforceable elements, such as limits on vehicle idling to no more than five consecutive minutes, and equipment reporting and labeling.

Because the project area includes the existing roadway and open grass lands, existing air emissions in the project area are primarily from vehicles traveling along the roadway. In addition, there is currently no ongoing soil disturbance in the project area, and potential deposits of NOA are currently intact. Therefore, existing emissions in the project area do not violate any air quality standards or contribute to air quality violations.

Operation of the project would not generate new stationary or mobile sources of criteria pollutant emissions because the project would maintain the same number of through lanes (one in each direction) and would not increase capacity or result in additional vehicles on the roadway. In addition, after construction is completed, there would be no soil disturbance resulting from the operation of the project, and all soil that potentially contains NOA would be contained beneath asphalt covering the roadway, or stabilized and hydroseeded with appropriate vegetative cover. Therefore, project operation would not generate additional emissions above existing conditions, and would therefore not violate any air quality standard or contribute substantially to an existing or projected air quality violation.

As described in Discussion a) above, project construction could generate fugitive dust and mobile source emissions of criteria pollutants and DPM. However, with implementation of standard measures in compliance with applicable Amador APCD rules and regulations, the project’s potential impacts from criteria pollutant and DPM emissions would be substantially minimized.

Project construction would require earth-moving activities involving over-excavation of areas surrounding the proposed roadway to a depth of five to 25 feet, and excavation would be
conducted over an area that is greater than one acre. All excavated soil would remain within the project area, and no off-site disposal of soil would be required. Because soil and rocks in the project area may contain NOA, there is potential that project construction could result in the exposure of adjacent receptors to dust from asbestos-containing rock and soils during earth disturbance activities. This would be a potentially significant impact related to air quality standards and violations.

**Mitigation Measures**

With the implementation of the following mitigation measures, dust with potential NOA would be controlled and contained during construction, reducing potential impacts to a level that is less than significant.

AIR-1: A California-registered geologist knowledgeable about asbestos-containing formations will inspect the project area for the presence of asbestos. If the investigation determines that NOA is present, then the County shall prepare and implement an Asbestos Dust Control Plan, as required in Section 93105 of the California Health and Safety Code, including measures to reduce exposures consistent with Section 93105(d) and (e) of the California Health and Safety Code. These measures shall include the following, and shall be implemented throughout the duration of any construction activity associated with the project:

- Unpaved areas subject to vehicle traffic must be stabilized by being kept adequately wetted, treated with a chemical dust suppressant, or covered with material that contains less than 0.25 percent asbestos.

- The speed of any vehicles and equipment traveling across unpaved areas must be no more than fifteen (15) miles per hour unless the road surface and surrounding area is sufficiently stabilized to prevent vehicles and equipment traveling more than 15 miles per hour from emitting dust that is visible crossing the project boundaries.

- Storage piles and disturbed areas not subject to vehicular traffic must be stabilized by being kept adequately wetted, treated with a chemical dust suppressant, or covered with material that contains less than 0.25 percent asbestos.

- Activities must be conducted so that no track-out from any road construction project is visible on any paved roadway open to the public.

- Equipment and operations must not cause the emission of any dust that is visible crossing the project boundaries.

The Asbestos Dust Control Plan shall be submitted to and approved by the Amador APCD prior to the commencement of construction activities. The County shall notify the Amador APCD in writing at least 14 days before any construction begins. Records related
to the compliance with the Asbestos Dust Control Plan must be kept in the County’s project files for seven years. The results of any air monitoring or sampling to document the applicability of, or compliance with, the regulation, and any other records specified in the Asbestos Dust Control Plan must be reported to the Amador APCD.

Timing/Implementation: Prior to start of any construction activities that could result in release of dust, and throughout project construction.

Enforcement/Monitoring: Amador County and Amador APCD.

c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

☐ Potentially Significant Impact ❋ Less Than Significant with Mitigation ❋ Less Than Significant Impact ☐ No Impact

Discussion c): Based on monitored air pollutant concentrations, the U.S. EPA and CARB designate an area’s status in attaining the NAAQS and CAAQS, respectively, for criteria pollutants. Amador County is currently designated as a nonattainment area for the state and federal O₃ standard. For all other criteria pollutants, the County is designated as either attainment and/or unclassified (an area that cannot be classified on the basis of available information).

Operation of the project would not add any new sources of criteria pollutant emissions to existing conditions because the project would maintain the same number of through lanes (one in each direction) and would not increase capacity or result in additional vehicles on the roadway. In addition, construction emissions would be short-term and intermittent, and with compliance with applicable Amador APCD rules and regulations, the project would not result in a cumulatively considerable net increase of criteria pollutants. Therefore, impacts would be less than significant.

d) Expose sensitive receptors to substantial pollutant concentrations?

☐ Potentially Significant Impact ❋ Less Than Significant with Mitigation ☐ Less Than Significant Impact ☐ No Impact

Discussion d): Sensitive receptors are persons who are more susceptible to air pollution than the general population, including children, athletes, the elderly, and the chronically ill. Typical
land uses where substantial numbers of sensitive receptors are often found are schools, daycare centers, parks, recreation areas, medical facilities, nursing homes, and convalescent care facilities. Residential areas are also considered to be sensitive to air pollution because residents (including children and the elderly) tend to be at home for extended periods of time, resulting in sustained exposure to pollutants. The only sensitive receptor near the project area is the Shenandoah Valley Charter School/Amador Community School approximately 500 feet west of the project area.

Operation of the project is not expected to increase pollutant emissions because the project would maintain the same number of through lanes (one in each direction) and would not increase capacity or result in additional cars on the roadway. Also, the project would not move emission sources closer to sensitive receptors adjacent to the project area. In addition, after construction is completed, there would be no soil disturbance resulting from the operation of the project, and all soil that potentially contains NOA would be contained beneath asphalt covering the roadway, or stabilized and hydroseeded with appropriate vegetative cover. Therefore, project operation would not generate additional emissions above existing conditions, and would not expose sensitive receptors to pollutants above existing conditions.

Construction activities would result in short-term, project-generated emissions of criteria pollutants and DPM from the exhaust of construction vehicles and off-road, heavy-duty diesel equipment used for grading and paving activities. However, there would be relatively few pieces of off-road, heavy-duty diesel equipment in operation, and the construction period would be relatively short (approximately six months total). Construction activities and delivery of construction materials and equipment for the project would comply with standard measures and applicable rules and regulations to minimize construction emissions. In addition, DPM is highly dispersive, and construction-related emissions of DPM would not be expected to result in exposure of sensitive receptors to substantial pollutant concentrations.

Because soil and rocks in the project area may contain NOA, there is potential that project construction could result in the exposure of sensitive receptors to dust from asbestos-containing rock and soils during earth disturbance activities. With the implementation of mitigation measure AIR-1 listed in Discussion b) above, which requires an Asbestos Dust Control Plan to be approved by the Amador APCD and implemented in compliance with CARB’s NOA ACTM, dust with potential NOA would be controlled and contained during construction, reducing potential impacts to a level that is less than significant.

e) Create objectionable odors affecting a substantial number of people?

☐ Potentially Significant Impact  ☐ Less Than Significant with Mitigation  ☒ Less Than Significant Impact  ☐ No Impact
Discussion e): Operation of construction equipment (diesel exhaust) and paving operations could result in the generation of odors; however, these odors would be temporary in nature, would be completed during daytime hours only, and would be isolated within the immediate vicinity of construction activities where there is not a substantial number of people. Therefore, potential odors from the project would not be expected to affect a substantial number of people, and impacts would be less than significant.

4. BIOLOGICAL RESOURCES

REGULATORY SETTING

The following discussion incorporates the results of the Natural Environment Study (GPA, 2015) and Biological Assessment (GPA, 2015) that were prepared for the project in August 2015 and November 2015, respectively. The following regulations are applicable to biological resources in the project area.

Federal Regulations

Federal Endangered Species Act

Section 7 of the Federal Endangered Species Act (FESA) requires federal agencies to ensure that actions they engage in, permit, or fund do not jeopardize the continued existence of endangered or threatened species, or result in the destruction or adverse modification of designated critical habitat for these species.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) (50 Code of Federal Regulations (CFR) Part 10 and Part 21) protects migratory birds, their occupied nests, and their eggs from disturbance or destruction. “Migratory birds” include all nongame, wild birds found in the U.S., except for the house sparrow (Passer domesticus), European starling (Sturnus vulgaris), and rock pigeon (Columba livia).

State Regulations

California Fish and Game Code

Sections 3503, 3513, and 3800 of the California Fish and Game Code prohibit the take of birds protected under the MBTA, and protects their occupied nests. All bat species are also protected under Section 4150 of the California Fish and Game Code. State-listed species and those petitioned for listing are protected under the California Endangered Species Act (CESA). Under Section 2080.1 of the California Fish and Game Code, if a species is both federally and state listed, a consistency determination with the protections of FESA permits (if there would be take of listed species) is required. Under Section 2081, if a species is state-listed only, consultation with the California Department of Fish and Wildlife (CDFW) is required in order to obtain an incidental take permit if the project could result in take of a state-listed species. Because the
project is not expected to result in impacts on state-listed species, consultation with the CDFW is not anticipated.

Invasive Species

Executive Order 13112 directs all federal agencies to refrain from authorizing, funding, or carrying out actions or projects that may spread invasive species. This order further directs federal agencies to prevent the introduction of invasive species, control and monitor existing invasive species populations, restore native species to invaded ecosystems, research and develop prevention and control methods for invasive species, and promote public education on invasive species. As the project proponent, the City or its designee, would be responsible for complying with Executive Order 13112 and ensuring that the project would not contribute to the spread of invasive species. Plants listed in the Pest Ratings of Noxious Weed Species and Noxious Weed Seed (California Department of Food and Agriculture, 2003) would not be used as part of the project.

Local Regulations

The County’s General Plan does not include relevant biological resources policies that are directly applicable to the project, nor does the County have a tree preservation policy or ordinance.

**Affected Environment**

The Biological Study Area (BSA) is in a rural area and existing vegetation consists primarily of non-native annual grasslands with sparse oak trees, blue oak woodland, and ruderal/disturbed roadside areas. There are vineyards and grazing land adjacent to the BSA. There are native and non-native plant species growing within and adjacent to the BSA.

The project area and BSA are located in the foothills of the Sierra Nevada Mountains. Topography in the BSA slopes gradually downward from east to west. To the west of Shenandoah Road, the land also slopes slightly downward from north to south. The elevation in the BSA ranges from approximately 1,205 feet above mean sea level (msl) at the eastern end to approximately 1,140 feet msl at the western end.

There are no aquatic resources, such as rivers, lakes, or streams, within or adjacent to the project area and BSA. There are intermittent roadside drainage ditches located adjacent to Shenandoah Road and Fiddletown Road, including two corrugated metal pipe culverts that convey water from north to south under Shenandoah Road, west of the intersection. These roadside drainage ditches convey water in a generally downhill, northeast to south/southwest direction. Drainages terminate in an isolated ditch on the vineyard parcel south of Shenandoah Road, where storm water percolates into the ground; therefore, roadside drainages in the area do not have connectivity to other drainage systems or waterways.
A search of the California Natural Diversity Database (CNDDB) was conducted, and a U.S. Fish and Wildlife Service (USFWS) species list was reviewed for the project to identify potential special-status wildlife and plant species that may occur in the project area. Several candidate, sensitive, and special-status plant and wildlife species have potential to be in the project area, based on geographic distribution. **Appendix A** contains a list of species with potential to occur in the project area, based on geographic distribution.

A biological reconnaissance survey was conducted for the project on February 6, 2015 to identify special-status wildlife and plant species or their habitats in the project area. During the reconnaissance biological survey, the entire BSA was visually surveyed on foot, and all plant and animal species and vegetation communities were inventoried to identify existing biological resources and determine the potential for special-status species to be in the BSA.

**Special-status Plants**

A second focused plant survey was conducted on April 2, 2015 for special-status plant species with potential to be in the biological study area (BSA). Focused plant surveys included visually observing the existing plant species within the entire survey area. No special-status plant species were identified in the BSA during either biological survey.

**Valley Elderberry Longhorn Beetle**

The Valley Elderberry Longhorn Beetle (VELB) (*Desmocerus californicus dimorphus*) is listed as a threatened species under FESA. The VELB is typically found in riparian habitats and is completely dependent upon its host plant, the elderberry. The leaves and flowers of the elderberry provide food for adult VELB, and the stems and roots of the plants provide food and shelter for developing larva. Two elderberry shrubs with stems measuring one inch or greater in diameter at ground level were observed within the BSA south of Fiddletown Road, east of the intersection. Although, no sign of the VELB was observed during a thorough inspection of the elderberry shrubs, the shrubs are suitable habitat for the VELB, and there is potential for this species to be in the BSA.

**California Red-legged Frog and California Tiger Salamander**

During the February 6, 2015 reconnaissance survey, a habitat assessment was conducted for the California red-legged frog (CRLF) (*Rana draytonii*) and the California tiger salamander (CTS) (*Ambystoma californiense*), in accordance with the **USFWS Revised Guidance on Site Assessments and Field Surveys for the California Red-Legged Frog** (USFWS, 2005) and the **USFWS Interim Guidance on Site Assessment and Field Surveys for Determining Presence or a Negative Finding of the California Tiger Salamander** (CDFW, 2003), respectively.

The results of the habitat assessment conducted within the BSA and adjacent properties were negative for CRLF and CTS. The nearest areas of designated critical habitat for the CRLF are approximately 16.3 miles south and 19 miles west of the BSA, and the nearest recorded occurrence is approximately 9.4 miles north from the BSA. The nearest designated areas of
critical habitat for the CTS are approximately 15.5 miles and 15.8 miles to the southwest of the BSA, and the nearest recorded occurrence is approximately 13 miles southwest from the BSA.

Bats

The pallid bat (*Antrozous pallidus*) has potential to be in the BSA based on existing habitat. During the biological survey conducted for the project, no bats were observed roosting in the trees, however, trees in the BSA may provide habitat for roosting bats, and there is the potential for bats to be in the BSA.

Birds

The BSA includes of trees and various types of vegetation that could provide suitable habitat for nesting birds, and there is the potential for migratory birds to be in the BSA. Thirteen bird species were observed foraging or flying over the BSA during surveys, including the acorn woodpecker (*Melanerpes formicivorus*), turkey vulture (*Cathartes aura*), yellow-billed magpie (*Pica nuttalli*), western scrub jay (*Aphelocoma californica*), spotted towhee (*Pipilo maculatus*), red-shouldered hawk (*Buteo lineatus*), red-tailed hawk (*Buteo jamaicensis*), golden-crowned sparrow (*Zonotrichia atricapilla*), black phoebe (*Sayornis nigricans*), white-crowned sparrow (*Zonotrichia leucophrys*), American kestrel (*Falco sparverius*), common raven (*Corvus corvax*), and mourning dove (*Zenaida macroura*).

**PROJECT IMPACTS**

Would the project:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

☐ Potentially Significant Impact  ☒ Less Than Significant Impact  ☐ Less Than Significant Impact  ☐ No Impact

**Discussion a):** Because no special-status plants were identified in the project area, the project is expected to have no impacts on special-status plants. Additionally, because the habitat assessment completed for CRLF and CTS was negative, the project would have no impact on these species.

**VELB**

Two elderberry shrubs are present adjacent to the project area, along a fence delineating the approximate County ROW line, approximately 50 feet south of Fiddletown Road. Although no sign of VELB were identified on the shrubs, the shrubs are considered potential habitat for the federally-listed VELB. While the project would not require removal of the shrubs, the USFWS
states that construction activities within 100 feet of elderberry shrubs could result in indirect impacts on VELB from construction dust, modification of habitat surrounding the shrubs, and inadvertent encroachment and damage of the shrubs by construction crews. Because the project would require construction activities to take place within 100 feet of elderberry shrubs, the project could have potentially significant indirect impacts on VELB during project construction.

**Mitigation Measures**

After implementation of the following mitigation measures, adverse impacts on VELB would be less than significant.

**BIO-1** Fencing and flagging will be placed around the elderberry shrubs to be avoided during construction activities to ensure that no activities will be conducted within a minimum of 20 feet from the dripline of each elderberry shrub.

**BIO-2** Signs will be installed at a minimum of 50 feet along the edge of the avoidance area with the following information: “This area is habitat of the valley elderberry longhorn beetle, a threatened species, and must not be disturbed. This species is protected by the Endangered Species Act of 1973, as amended. Violators are subject to prosecution, fines, and imprisonment.” The signs will be clearly readable from a distance of 20 feet, and will be maintained for the duration of construction.

**BIO-3** All work crews will be informed about the status of the VELB, and the need to protect the elderberry shrub as its host plant, and will be briefed on the possible penalties for not complying with the avoidance requirements.

**BIO-4** Upon completion of the project, all temporarily disturbed areas will be restored to pre-project conditions, as feasible.

**BIO-5** Any damage to the area within 100 feet of the elderberry shrubs will be restored following construction, and the area will be revegetated with native plants.

**BIO-6** Surrounding areas will be watered down to keep dust from the shrub’s driplines.

**Timing/Implementation:** Prior to start of construction activities, and throughout project construction.

**Enforcement/Monitoring:** Amador County.

**Bats**

Bats could be directly impacted if they are roosting in the trees removed during construction. Construction noise and vibration could indirectly impact bats if they are roosting immediately adjacent to construction activities, and are disturbed by these activities. Tree removal could result in a minor reduction of available roosting habitat in the immediate area. These would be considered potentially significant impacts.
Mitigation Measures

After implementation of the following mitigation measures, adverse impacts on bats would be less than significant.

BIO-6 Prior to construction, all trees within 100 feet of the project area will be surveyed by a qualified bat specialist to determine the presence/absence of bats and any active or potential bat-roosting cavities. During the non-breeding and active season, any bats roosting in trees will be safely evicted under the direction of a bat specialist and under consultation with the CDFW.

BIO-7 Once it has been determined that all roosting bats have been safely evicted from roosting cavities, exclusionary devices approved by the CDFW will be installed and maintained to prevent bats from roosting in these cavities prior to and during construction.

BIO-8 Pre-construction bat surveys will be conducted by a qualified bat specialist no more than seven days prior to the removal of any trees within the project area to confirm that exclusionary measures have been successful and there are no bats within the project area. If no roosting bats are detected, no further surveys will be required provided the tree removal is completed within seven days. If removal is delayed more than seven days from the survey date, additional surveys will be conducted no more than seven days prior to tree removal to ensure that no bats have moved into the area.

BIO-9 Surveys and exclusion measures are expected to prevent maternal colonies from becoming established within 100 feet of the project area. In the event that a maternal colony of bats is found, the CDFW will be consulted, and no work will be conducted within 100 feet of the maternal roosting site until the maternal season is over or the bats have left the site, or as otherwise directed by the CDFW. The site will be designated as a sensitive area and protected until the bats have left the site or the young bats are volant (i.e., capable of flying). No clearing and grubbing will be authorized within 100 feet adjacent to the roosting site. Combustion equipment, such as generators, pumps, and vehicles, will not be parked or operated under or within 100 feet of the roosting site. Construction personnel will not enter into areas beneath the colony, especially during the evening exodus.

Timing/Implementation: Prior to start of construction activities, and throughout project construction.

Enforcement/Monitoring: Amador County.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?
Discussion b): There is no riparian habitat or other sensitive natural communities located in the project area; therefore, there would be no impact on these resources.

c) **Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?**

Discussion c): There are no federally protected wetlands or other waters of the U.S. or state in or near the project area, nor do any storm water drainages in the project area have any connectivity to these resources; therefore, there would be no impact.

d) **Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?**

Discussion d): The project does not contain any rivers, streams, or lakes; therefore, there would be no impacts on migratory fish. A query of the CDFW Biogeographic Information and Observation System (BIOS) and a site survey were conducted to determine the likelihood for the BSA to be used as a migratory wildlife corridor. The BSA consists of trees and various types of vegetation that could provide suitable habitat for nesting birds. Tree and vegetation removal could result in direct impacts on migratory birds and raptors if these activities are conducted while birds are nesting within or adjacent to the affected areas. Temporary noise-generating activities, such as excavation, grading, and paving, could also result in temporary indirect impacts on nesting birds and raptors if they were loud enough to result in disturbance. These would be considered potentially significant impacts.

**Mitigation Measures**

With implementation of the following mitigation measures, adverse impacts on nesting migratory bird species and raptors would be less than significant.
BIO-10 If construction is scheduled to begin during bird nesting season (typically February 15 to September 15), nesting bird surveys will be completed no more than 48 hours prior to construction to determine if there are any nesting birds or active nests within or adjacent to the project area (within 300 feet for birds and 500 feet for raptors). Surveys will be repeated if construction activities are suspended for three days or more.

BIO-11 If nesting birds are found in the BSA, appropriate buffers consisting of orange flagging/fencing or similar (typically 300 feet for birds and 500 feet for raptors) will be installed and maintained until nesting activity has ended, as determined in coordination with the project biologist and regulatory agencies, as appropriate.

Timing/Implementation: Prior to start of construction activities, and throughout project construction.

Enforcement/Monitoring: Amador County.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

[ ] Potentially Significant Impact [ ] Less Than Significant with Mitigation

[ ] Less Than Significant Impact [ ] No Impact

Discussion e): The County’s General Plan does not identify any policies to protect biological resources, nor does the County have a tree preservation policy or ordinance. Parcels south of Shenandoah Road, west of the intersection, are within the jurisdiction of the City of Plymouth, which requires a permit for removal of protected trees in accordance with the City’s municipal code. However no trees would be removed from parcels within the City of Plymouth jurisdiction; therefore, the City of Plymouth’s Municipal Code would not apply to the project.

The project would require removal of a small number of medium to large oak trees in the northwest and southeast portion of the project area, and possible removal of one pine tree in the southeast portion of the project area, to accommodate the intersection and approach roadways realignment. Because Amador County does not have any policies or ordinances to protect biological resources, including trees, the project would not conflict with any local policies or ordinances protecting biological resources, and impacts would be less than significant.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

[ ] Potentially Significant Impact [ ] Less Than Significant with Mitigation

[ ] Less Than Significant Impact [ ] No Impact
Discussion f): There are no Habitat Conservation Plans, Natural Community Conservation Plans, or other local, regional, or state habitat conservation plans that apply to the project area. Therefore, there would be no impact.

5. CULTURAL RESOURCES

REGULATORY SETTING

Federal Regulations

National Historic Preservation Act

The National Historic Preservation Act (NHPA) is legislation intended to preserve historical and archaeological sites in the U.S. Section 106 of the NHPA requires federal agencies to take into account the effects of their undertaking on historic properties, and afford the Advisory Council on Historic Preservation a reasonable opportunity to comment.

State Regulations

CEQA Section 15064.5

Under CEQA, CCR, Title 14, Section 15064.5(a)(3), a resource is considered historically significant if it meets one of the following four criteria:

- It is associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage
- It is associated with the lives of persons important in our past
- It embodies the distinctive characteristics of a type, period, region, or method of installation, or represents the work of an important creative individual, or possesses high artistic values; or
- It has yielded, or may be likely to yield, information important in prehistory or history.

CEQA requires public agencies and private interests to identify the potential adverse impacts or environmental consequences of their project on any object or site of significance with respect to history. CEQA also provides protection for paleontological remains.

California Public Resources Code

PRC 21083.2, 5097.5, 30244, and 21084.1

According to PRC 21083.2 (a), if archaeological resources are determined to be significant, then the impacts on that resource should be addressed. PRC 5097.5 prohibits the excavation and/or the removal of a “vertebrate paleontological site...or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands.” PRC 30244
requires reasonable mitigation of adverse impacts on paleontological resources resulting from development on public land.

PRC 21084.1 gives the lead agency power to determine that a resource is a historical resource, even if the resource is not listed or eligible for listing in the California Register of Historical Resources or a local register of historical places. In addition, the lead agency can also determine that a resource is a historical resource, even if it is not deemed significant in a historical resource survey.

*Native American Heritage Act (PRC 5097.9)*

The Native American Heritage Act, passed by California in 1976, established the Native American Heritage Commission (NAHC) for protecting Native American religious values on state property. The NAHC not only protects the heritage of Native Americans, but also ensures their participation in matters concerning heritage sites. The commission’s duty is to assist both federal and state agencies in protecting Native American sacred places and provide recommendations concerning Native American heritage in accordance with environmental law and policy. The act protects burials from disturbance, vandalism, and accidental destruction. It also stipulates which specific procedures laid out in the California Health and Safety Code must be implemented if a Native American burial is uncovered during project construction or archaeological data recovery.

*Assembly Bill 52 (PRC 21080.1, 21080.3.1, and 21080.3.2)*

As of July 1, 2015, Assembly Bill (AB) 52 requires public agencies to consult with California Native American tribes identified by the NAHC for the purpose of mitigating impacts on tribal cultural resources. The specific directives of the bill are as follows:

Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section (PRC Section 21080.1(d)).

*California Health and Safety Code Section 7050.5*

California Health and Safety Code Section 7050.5 requires that if human remains are discovered during ground disturbing activities, the County Coroner must be notified, and no further disturbance is authorized to occur until the County Coroner has made a determination of origin and disposition of the remains. If the human remains are determined to be prehistoric, the coroner must notify the NAHC, who will determine and notify a Most Likely Descendant (MLD). The MLD then inspects the site and may recommend scientific removal.
and nondestructive analysis of human remains and items associated with Native American burials.

**Local Regulations**

The County’s General Plan identifies the following objective related to historical resources (Amador County, 1967):

- To protect, and carefully develop where appropriate, the varied resources for public recreation in scenic and historical areas, hunting and fishing area, lakes and waterways, forests and wilderness, and urban open spaces.

**Affected Environment**

**Completed Studies and Consultations**

Cultural resources studies, including a Historic Property Survey Report (HPSR) and an Archaeological Survey Report (ASR), were prepared by William Self and Associates (WSA) in July 2015 to fulfill the requirements of CEQA, as well as several federal laws such as Section 106 of the NHPA (William Self and Associates, 2015). As part of this effort, a records search, consultation with local historical societies, consultation with the NAHC, and consultation with interested Native American individuals/organizations were conducted in an effort to identify any known cultural resources within a 1-mile radius of the project area.

The NAHC consultation did not identify any known prehistoric resources within the project study area. Ten potentially interested Native American parties identified by the NAHC were contacted by letter, telephone, and email for comment on the project. Roselynn Lwenya, speaking on behalf of Ms. Rhonda Morningstar Pope, chairperson of the Miwok of Buena Vista Rancheria, requested a copy of the report and requested that a tribal member monitor ground disturbance. Mr. Sam Baugh, Cultural Resources Representative for the Jackson Rancheria Band of Miwok Indians, indicated that the project area, and the surrounding countryside and roadways, could be sensitive for burials associated with early pioneers and epidemic victims in the county. No other recommendations or concerns were received as a result of Native American consultation.

Two cultural resource studies have been previously conducted within or immediately adjacent to the project area. Nineteen archaeological studies have been conducted within a 1-mile radius of the project area. No evidence of prehistoric cultural resources was found in the project area as a result of these investigations. One historic resource, the Plymouth Catholic Cemetery, has been identified just south of the Project area.

WSA conducted a pedestrian survey of the exposed and accessible ground surface within the project study area. No cultural resources were identified during the survey, and no evidence of prehistoric cultural deposits was found in the project area.
Assembly Bill 52 (PRC 21080.1, 21080.3.1, and 21080.3.2)

On September 1, 2015, the NAHC completed a Sacred Lands File records search of the project study area to identify known prehistoric sites and Native American traditional cultural places and cultural landscapes. No sites were identified as a result of the records search. The NAHC also provided a consultation list of Native American tribes with traditional lands or cultural places within the boundaries of the project study area to contact under the provisions of AB 52.

GPA contacted five Native American parties identified by the NAHC through letter, telephone, and email for comment on the project. Mr. Randy Yonemura, representing the Ione Band of Miwok Indians, called GPA’s Environmental Project Manager, Ms. Melissa Logue, on October 2, 2015 to request more information on the project and to help him determine if there could be Native American sites in the project area. Mr. Yonemura indicated that a burial may be in the vicinity. Ms. Logue provided additional project information to Mr. Yonemura at his request, and conducted two follow-up phone calls and left voice mail messages to verify that the information provided met his needs. Mr. Yonemura was also asked if he wished to enter into consultation on the project under the provisions of AB 52. No further response, information, or communication was received from Mr. Yonemura following these communications. Appendix B, Summary of AB 52 Coordination, summarizes all correspondence and communication completed for the project pursuant to the requirements of AB 52.

Known Historic and Prehistoric Resources

No historic or prehistoric cultural resources have been recorded or identified within the project study area. However, there are known resources adjacent to and surrounding the project area.

The Plymouth Catholic Cemetery is located immediately south of the project area. The Plymouth Catholic Cemetery consists of two graves, and is located south of Shenandoah Road and surrounded by the Sutter Home vineyard property. It is owned by the Catholic Church of Plymouth. This site is the presumed location of the graves of an Austrian miner, named Mr. Blas Glaich (died 1884), and another Austrian, Mrs. Perovich. During a 1978 oral history, Plymouth resident Mr. Martin Lubenko indicated that “he was told there were additional interments at the cemetery, but the locations of these burials is unknown” (William Self and Associates, 2015).

Nineteen historic cultural resources have been recorded within a 1-mile radius of the project area. These sites are primarily associated with sites related to the region’s mining history (i.e., historic mines, mine tailings, quarries, water conveyance structures, etc.).

Eleven prehistoric cultural resources were identified within a 1-mile radius of the project area. These resources consist primarily of Native American bedrock milling features, although other resource types, such as lithic scatters, hearth pits, and possible burials, were also identified.

Survey Results

WSA conducted a pedestrian survey of the exposed and accessible ground surface within the project study area. During the course of the survey, no signs of cultural material were observed
in the survey area. Due to the high grasses throughout the survey area, visibility was limited to 10 percent in most areas; however, the presence of frequent rodent burrows throughout the survey allowed for some observation of the sub-surface soil. As no cultural material was observed during the pedestrian survey, WSA determined that it is unlikely that cultural resources are located in the project area.

**PROJECT IMPACTS**

Would the project:

a) **Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?**

- [ ] Potentially Significant Impact
- [x] Less Than Significant with Mitigation
- [ ] Less Than Significant Impact
- [ ] No Impact

**Discussion a):** The project would include realigning the intersection of Shenandoah Road and Fiddletown Road and the roadway approaches to the northwest of the intersection’s existing location. The historic Plymouth Catholic Cemetery is located south of Shenandoah Road, outside of the existing County ROW and beyond the project area. Because project activities would be completed north of the existing County ROW through this area, it is anticipated that there would be no disturbance to the cemetery during project construction; however, the cemetery could be impacted if construction activities inadvertently extended south of the County ROW in this area. This could result in a potentially significant impact on an historic resource.

**Mitigation Measures**

After implementation of the following mitigation measures, impacts would be less than significant.

**CUL-1** Environmentally Sensitive Area (ESA) fencing, or another appropriate, highly-visible barrier, will be installed along the southern limit of the existing County ROW at an appropriate length to provide a visible and physical barrier between the cemetery and construction activities. The limits of the existing County ROW and location of ESA fencing will be identified in the project plans and specifications.

**Timing/Implementation:** Prior to start of ground disturbing activities and throughout project construction.

**Enforcement/Monitoring:** Amador County

**CUL-2** If human remains are uncovered during construction activities, ground disturbing activities in the area will stop, and the County Coroner will be notified pursuant to the requirements of the California Health and Safety Code Section 7050.5. No further
disturbance in the area will occur until the County Coroner has made a determination of origin and disposition of the remains. If the human remains are determined to be prehistoric, the coroner will notify the NAHC, who will determine and notify a MLD. The County will coordinate with the MLD to identify appropriate analyses and treatment or disposition of the remains and any items associated with Native American burials.

Timing/Implementation: Throughout project construction.

Enforcement/Monitoring: Amador County

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

☐ Potentially Significant Impact ☒ Less Than Significant with Mitigation ☐ Less Than Significant Impact ☐ No Impact

Discussion b): Project construction would require ground disturbance, with excavation up to 25 feet deep. Although there are no known archaeological sites within the project area, the discovery of archaeological resources is a possibility during sub-surface work, which could result in disturbance of the resources. Disturbance of a previously unidentified archaeological resource during construction would be a potentially significant impact.

Mitigation Measures

With implementation of the following mitigation measure, impacts would be less than significant.

CUL-3 If archaeological resources, paleontological resources, or unique geologic features are encountered during construction, all ground-disturbing work will be stopped until an archaeologist or monitor can properly assess the resources(s) and identify the appropriate measures to ensure that the resources will not be adversely affected.

Timing/Implementation: Throughout project construction

Enforcement/Monitoring: Amador County

c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

☐ Potentially Significant Impact ☒ Less Than Significant with Mitigation ☐ Less Than Significant Impact ☐ No Impact

Discussion c): See Discussion b) above. Although not anticipated, the discovery of paleontological or unique geologic features is a possibility during sub-surface work, which could
result in disturbance of the resources and potentially significant impacts. However, with implementation of mitigation measure CUL-3 listed above, impacts would be less than significant.

d) Disturb any human remains, including those interred outside of formal cemeteries?

- Potentially Significant Impact
- Less Than Significant with Mitigation

**Discussion d)**: See Discussions a) and b) above. The historic Plymouth Catholic Cemetery is located adjacent to the project area. While two interments are identified within the cemetery, there is potential for other previously unidentified remains associated with the cemetery to be in the area. Also, although other burials have not been identified in the project area, consultations with Native American representatives indicates that there may be potential for other burials not associated with the cemetery (e.g., early pioneers, epidemic victims, and Native Americans) to be in the area. Although not anticipated, the discovery of human remains is a possibility during sub-surface work, which could result in disturbance of the resources and could be a potentially significant impact. However, with implementation of mitigation measures CUL-1, CUL-2, and CUL-3, impacts would be less than significant.

6. GEOLOGY AND SOILS

**Regulatory Setting**

State Regulations

**Alquist-Priolo Earthquake Fault Zoning Act**

The Alquist-Priolo Earthquake Fault Zoning Act (AP Act) (PRC Sections 2621 to 2630) was passed in 1972 to provide a statewide mechanism for reducing the hazard of surface fault rupture to structures used for human occupancy. The main purpose of the AP Act is to prevent the siting of buildings used for human occupancy across the traces of active faults. It should be noted that the AP Act addresses the potential hazard of surface fault rupture and is not directed toward other earthquake hazards, such as seismically induced ground shaking or landslides.

The law requires the State Geologist to identify regulatory zones (known as Alquist-Priolo (AP) Fault Zones) around the surface traces of active faults, and to depict these zones on topographic base maps, typically at a scale of 1 inch to 2,000 feet. AP Fault Zones vary in width, although they are often 0.75 mile wide. Once published, the maps are distributed to the affected cities, counties, and state agencies for their use in planning and controlling new or renewed construction. With the exception of single-family wood-frame and steel-frame dwellings that are not part of a larger development (i.e., four units or more), local agencies are required to regulate development within the mapped zones. In general, construction within 50 feet of an active fault zone is prohibited.
Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act (SHMA) (PRC Sections 2690 to 2699.6), which was passed in 1990, addresses earthquake hazards other than surface fault rupture. These hazards include strong ground shaking, earthquake-induced landslides, liquefaction, or other ground failures. Much like the AP Act discussed above, these seismic hazard zones are mapped by the State Geologist to assist local government in the land use planning process. SHMA states, “It is necessary to identify and map seismic hazard zones in order for cities and counties to adequately prepare the safety element of their general plans and to encourage land use management policies and regulations to reduce and mitigate those hazards to protect public health and safety.” SHMA also states, “Cities and counties shall require, prior to the approval of a project located in a seismic hazard zone, a geotechnical report defining and delineating any seismic hazard.”

California Building Code

The State of California provides minimum standards for building design through the California Building Standards Code (CBC) (CCR, Title 24). Where no other building codes apply, Chapter 29 regulates excavation, foundations, and retaining walls. The CBC applies to building design and construction in the state and is based on the federal Uniform Building Code (UBC) used widely throughout the country (generally adopted on a state‐by‐state or district‐by‐district basis). The CBC has been modified for California conditions with more detailed and/or more stringent regulations.

The State Earthquake Protection Law (California Health and Safety Code Section 19100, et seq.) requires that structures be designed to resist stresses produced by lateral forces caused by wind and earthquakes. Specific minimum seismic safety and structural design requirements are set forth in Chapter 16 of the CBC. The CBC identifies seismic factors that must be considered in structural design. Chapter 18 of the CBC regulates the excavation of foundations and retaining walls, and Appendix Chapter A33 regulates grading activities, including drainage and erosion control and construction on unstable soils, such as expansive soils and areas subject to liquefaction. The CBC is updated every three years, and the current 2013 CBC took effect January 1, 2014.

Local Regulations

The County’s General Plan includes the following objective regarding seismic safety (Amador County, 2014):

- Objective A: the objective of the preparation and adoption of the Safety and Seismic Safety Element is to add safety considerations to the active planning processes within the planning area in order to reduce loss of life, injuries, damage to property, economic loss, and social disruption resulting from fire, seismic activity, and other possible disasters.
**Affected Environment**

The project is located on the western slope of the Sierra Nevada geomorphic province. The 450-mile long Sierra Nevada mountain range is a 40- to 50-mile wide west dipping fault block (i.e., a very large block of rock) consisting of a series of uplifted Mesozoic (225 million years ago) granitic batholiths (i.e., rock that forms from cooled magma deep in the Earth's crust) overlain by metamorphic and volcanic rock units. Elevations in the mountain range extend from 400 feet in the western foothills up to 14,000 feet on its eastern edge where there are high peaks and dramatic relief. Steep, rocky faces and glacier carved valleys feed high-energy streams that flow to rolling foothills, where the province's western boundary abuts the Great Valley.

The project area is within an area of low seismic activity with a moderate earthquake risk. The project is not located within the AP Fault Zone, and is not in an area subject to liquefaction, ground failure, or surface rupture.

**Project Impacts**

Would the project:

a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

   i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

   | Potentially Significant Impact | Less Than Significant with Mitigation | Less Than Significant Impact | No Impact |

   **Discussion a) i):** The project area is outside of the AP Fault Zone, and there are no AP faults in Amador County. The closest known AP fault is the Markleeville Fault approximately 55 miles northeast of the project area. Because the project would not include new structures, the potential for exposure of people or structures to risks of loss, injury, or death is considered low; therefore, impacts would be less than significant.

   ii) Strong seismic ground shaking?

   | Potentially Significant Impact | Less Than Significant with Mitigation | Less Than Significant Impact | No Impact |

   **Discussion a) ii):** See response a) i) above. The potential severity of ground shaking depends on many factors, including distance from the originating fault, the earthquake magnitude, and the
nature of the subsurface materials. Because no residential dwellings would be constructed as part of the project, the potential for exposure of people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking is considered low; therefore, impacts would be less than significant.

iii) Seismic-related ground failure, including liquefaction?

- Potentially Significant Impact
- Less Than Significant Impact
- Less Than Significant Impact
- No Impact

 Discussions a) iii): See response a) i) above. Liquefaction in soils and sediments occurs during earthquake events when soil material is transformed from a solid state to a liquid state generated by an increase in pressure between pore space and soil particles. No specific liquefaction hazard areas have been identified in the county (Amador County, 2014). Because the project would be limited to improvements of an existing intersection and would not include new structures, the potential for exposure of people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving liquefaction is considered low; therefore, impacts would be less than significant.

iv) Landslides?

- Potentially Significant Impact
- Less Than Significant Impact
- Less Than Significant Impact
- No Impact

 Discussions a) iv): The project area is not located in an area that is typically associated with landslides. Additionally, according to the CDOC, the project area is not in a landslide hazard area. Therefore, there would be no impact.

b) Result in substantial soil erosion or the loss of topsoil?

- Potentially Significant Impact
- Less Than Significant Impact
- Less Than Significant Impact
- No Impact

 Discussions b): According to the U.S. Department of Agriculture (USDA) Web Soil Survey, soils in the project area have a low to moderate susceptibility to erosion (USDA, 2013). Project construction would require the removal of some existing vegetation. Project construction would be subject to the requirements of the National Pollutant Discharge Elimination System (NPDES) permit required for the project, which requires implementation of best management practices (BMP) to minimize soil erosion and protect water quality. Typical BMPs include, but are not
limited to, limiting the construction area to the smallest area required to complete construction; dust control measures, such as watering exposed soils; and use of silt fencing, fiber rolls, and sheeting to contain soils on site during storm events. Following construction, exposed soils would either be paved or be stabilized through compaction and/or new vegetation. With implementation of standard BMPs and compliance with the NPDES requirements, the project would not be expected to result in soil erosion or loss of topsoil; therefore, impacts would be less than significant.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

- Potentially Significant Impact
- Less Than Significant with Mitigation
- Less Than Significant Impact
- No Impact

**Discussion c):** According to the CDOC, the project area is not in a landslide hazard area. The project area does not contain steep slopes or unstable terrain; therefore, there is low risk of landslides. The risk of land surface subsidence in Amador County is low, and there are no areas where subsidence has previously occurred in proximity to the project area. No specific liquefaction hazard areas have been identified in the county.

Project design would be consistent with standard engineering practices and would adhere to applicable standards related to safety. In addition, because the project would be limited to the improvements of a roadway and would not include new structures, the potential for the project to result in geologic or soil instability, or potentially result in lateral spreading, liquefaction, or collapse, is considered low. Therefore, impacts would be less than significant.

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

- Potentially Significant Impact
- Less Than Significant with Mitigation
- Less Than Significant Impact
- No Impact

**Discussion d):** According to the County’s General Plan, Seismic Safety Element, the project area and surrounding areas have a low risk of expansive soils (Amador County, 2014). Therefore, there is a low potential that the project would be located on expansive soil, and there would be no impact.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?
Discussion e): The project would be limited to improvements of an existing roadway intersection, and would not require the installation of septic tanks or alternative wastewater disposal systems. Therefore, there would be no impact.

7. GREENHOUSE GAS EMISSIONS

REGULATORY SETTING

Federal Regulations

Greenhouse Gas Endangerment

On December 7, 2009, the U.S. EPA signed two distinct findings regarding greenhouse gases (GHG) under Section 202(a) of the FCAA:

- The U.S. EPA finds that the current and projected concentrations of the mix of six key GHGs—carbon dioxide (CO$_2$), methane (CH$_4$), nitrous oxide (N$_2$O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), and sulfur hexafluoride (SF$_6$)—in the atmosphere threaten the public health and welfare of current and future generations. This is referred to as the endangerment finding.

- The U.S. EPA finds that the combined emissions of CO$_2$, CH$_4$, N$_2$O, and HFCs from new motor vehicles and motor vehicle engines contribute to the atmospheric concentrations of these key GHGs and hence to the threat of climate change. This is referred to as the cause or contribute finding.

The findings do not include any proposed regulations.

State Regulations

There are numerous state plans, policies, regulations, and laws related to GHGs and global climate change that 1) establish overall state policies and GHG reduction targets; 2) require state or local actions that result in direct or indirect GHG emission reductions for the project; 3) require CEQA analysis of GHG emissions; and 4) provide generally-accepted guidance in performing GHG analyses. The major components of California’s climate change policy are reviewed below.
Assembly Bill 32, the California Global Warming Solutions Act of 2006

AB 32 was signed by former Governor Arnold Schwarzenegger in September 2006, and is now codified as Sections 38500–38599 of the California Health and Safety Code. Assembly Bill 32 requires that statewide GHG emissions be reduced to 1990 levels by 2020.

Senate Bill 97 and Amendments to the State CEQA Guidelines

CARB GHG Emissions Data and Scoping Plan

AB 32 requires CARB to develop a scoping plan to lower the state’s GHG emissions to meet the 2020 limit. The AB 32 Scoping Plan was approved at the December 2008 CARB meeting, and the First Update to the AB 32 Scoping Plan was approved in May 2014 (CARB, 2014). Key elements of the scoping plan include expanding and strengthening existing energy efficiency programs and building and appliance standards; achieving a statewide renewable energy mix of 33 percent; developing a California cap and trade program linked with other similar programs; establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets; implementing existing laws and standards, such as California’s clean car standards, goods movement measures, and the Low Carbon Fuel Standard; and issuing targeted fees to fund the state’s long-term commitment to AB 32 administration.

Affected Environment

According to climate scientists, the earth’s climate has been warming for the past century; it is believed by 97 percent of climate scientists that this warming trend is related to the release of certain gases into the atmosphere by human activities (NASA, 2015). The most commonly recognized GHGs include CO$_2$, CH$_4$, N$_2$O, water vapor, ozone, aerosols, HFCs, chlorofluorocarbons (CFCs), PFCs, and SF$_6$.

Emissions of GHGs contributing to global climate change are largely attributable to human activities associated with industrial/manufacturing, utility, transportation, residential, and agricultural sectors. About 75 percent of human emissions of CO$_2$ to the global atmosphere during the past 20 years are a result of fossil fuel burning. Atmospheric concentrations of CO$_2$, CH$_4$, and N$_2$O have increased 31 percent, 151 percent, and 17 percent, respectively, since the year 1750 (Intergovernmental Panel on Climate Change, 2001).

Worldwide, California is ranked as the 12th largest emitter of GHGs. Based on the most recent GHG emissions inventory, California’s gross annual emissions of GHGs in 2013 totaled 459.3 million metric tons of carbon dioxide equivalents (MTCO$_2$e) (CARB, 2013). Most of California’s...
emissions, approximately 81 percent, consist of CO\textsubscript{2} produced from fossil fuel combustion. The transportation sector is the single largest category of California’s GHG emissions, accounting for approximately 37 percent of the state’s total GHG emissions, followed by electricity consumption (from both in-state and out-of-state providers), which accounts for a total of roughly 23 percent of the state’s total GHG emissions, and then the industrial sector accounting for approximately 20 percent of the state’s total GHG emissions. The contribution from each of the various other use sectors contribute roughly one to eight percent each to the total GHG emissions inventory (CARB, 2013).

**PROJECT IMPACTS**

Would the project:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

- [ ] Potentially Significant Impact
- [ ] Less Than Significant with Mitigation
- [x] Less Than Significant Impact
- [ ] No Impact

**Discussion a):** Operation of the project would not be expected to increase GHG emissions because the same number of through lanes (one in each direction) would be maintained, and the project would not increase capacity or result in additional traffic volumes on the roadway. The use of heavy mobile construction equipment, such as bulldozers, trucks, scrapers, etc., delivery of construction materials, hauling of construction debris, and worker commutes would result in the generation of GHGs during construction. However, construction would be short-term and temporary (completed within six months), and the project’s contribution of GHG emissions to climate change would be minimal. Therefore, impacts would be less than significant.

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

- [ ] Potentially Significant Impact
- [ ] Less Than Significant with Mitigation
- [x] Less Than Significant Impact
- [ ] No Impact

**Discussion b):** Statewide GHG emissions are currently regulated through AB 32, which requires the state’s GHG emissions to be reduced to 1990 levels by 2020. The use of heavy mobile construction equipment, delivery of construction materials, hauling of construction debris, and worker commutes would result in the generation of GHGs. However, because construction would be short-term and temporary, project contributions to GHG emissions would be minimal,
and would not be expected to conflict with any local or state targets for GHG emissions reduction; therefore, impacts would be less than significant.

8. HAZARDS AND HAZARDOUS MATERIALS

REGULATORY SETTING

The following discussion incorporates the results of the Phase I Initial Site Assessment that was prepared for the project on May 2015 (GPA, 2015). The following regulations are applicable to hazards and hazardous materials in the project area.

Federal Regulations

U.S. Environmental Protection Agency

The U.S. EPA’s purpose is to protect human health and the environment by writing and enforcing regulations based on laws passed by Congress. The U.S. EPA relies on the National Priorities List (NPL), which is a list of national priorities among the known releases or threatened releases of hazardous substances, pollutants, or contaminants throughout the U.S. and its territories. The NPL is intended primarily to guide the U.S. EPA in determining which sites warrant further investigation.

CERCLIS is a database used by the U.S. EPA to track activities conducted under its Superfund program. Specific information is tracked for each individual site. WasteLAN is the name of the regional version of this database.

Resource Conservation and Recovery Act (RCRA)

RCRA Subtitle C addresses hazardous waste generation, handling, transportation, storage, treatment, and disposal. RCRA establishes a system that uses hazardous waste manifests to track the movement of hazardous waste from generation to disposal (cradle-to-grave). The 1984 amendments to RCRA created a national priority for waste minimization. Subtitle D establishes national minimum requirements for solid waste disposal sites and practices, and requires States to develop plans for the management of wastes within their jurisdictions. Subtitle I requires monitoring and containment systems for underground storage tanks (USTs) that hold hazardous materials. Owners of USTs must demonstrate financial assurance for the cleanup of a potential leaking tank.

State Regulations

Hazardous Waste and Substances Site List - Site Cleanup (Cortese List)

The Hazardous Waste and Substances Sites (Cortese) List is a planning document used by state and local agencies and developers to comply with CEQA requirements by providing information about the location of hazardous materials release sites. Government Code Section 65962.5 requires the California Environmental Protection Agency to develop an updated Cortese List at
least annually. The California Department of Toxic Substances Control (DTSC) is responsible for a portion of the information contained in the Cortese List. Other state and local government agencies are required to provide additional hazardous material release information for the Cortese List.

**Department of Toxic Substances Control (EnviroStor/Haznet)**

The mission of the DTSC is to provide the highest level of safety, and to protect public health and the environment from toxic harm. DTSC provides a listing of all existing information on permits and corrective action at hazardous waste facilities, as well as site cleanup projects on the EnviroStor/Haznet database.

**California Hazardous Waste Control Law**

The California Hazardous Waste Control Law (HWCL) is the primary hazardous waste statute in the California. The law states that generators have the primary duty to determine whether their wastes are hazardous and to ensure their proper management. HWCL also establishes criteria for the reuse and recycling of hazardous wastes. The law exceeds RCRA requirements by mandating source reduction planning, and a much broader requirement for permitting facilities that treat hazardous waste. The law also regulates a number of types of wastes and waste management activities that are not covered by RCRA.

**California Code of Regulations**

Most state and federal regulations and requirements that apply to generators of hazardous waste are spelled out in CCR, Title 22, Division 4.5. Title 22 contains detailed compliance requirements for hazardous waste generators and transporters, and treatment, storage, and disposal facilities. Most RCRA regulations have been duplicated and integrated into Title 22. However, because DTSC regulates hazardous waste more stringently than the U.S. EPA, Title 22 contains fewer exemptions and exclusions than RCRA, and regulates a wider range of waste types and waste management activities. To make regulatory requirements more accessible and easier to follow, California compiled the hazardous materials, waste, and toxics-related regulations into CCR, Title 26, “Toxics.”

**Local Regulations**

The County Environmental Health Department is a Certified Unified Program Agency (CUPA) and administers a consolidated hazardous materials program in the county. State-wide hazardous materials programs were established by Senate Bill 1082 and enforced by the California Environmental Protection Agency. This bill unified hazardous waste and hazardous materials management through the use of a regulatory program.

The Amador County Sheriff’s Office of Emergency Services is responsible for coordinating emergency response and evacuation procedures in the project area, and implementing the Amador County Evacuation Plan and Amador County Emergency Operations Plan.
Affected Environment

A May 2015 Phase I Initial Site Assessment (ISA) was prepared for the project by Wallace-Kuhl and Associates (WKA) to evaluate environmental conditions associated with the property’s past and current use. The Phase I ISA was prepared in accordance with the scope and limitations of American Standard of Testing Materials (ASTM) Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment (ESA) Process (Designation E 1527-05, Standard Practice for ESAs). The purpose of the Phase I ISA was to assist the County in recognizing “environmental conditions” in the project area. A recognized environmental condition (REC) is defined by the ASTM as:

The presence or likely presence of hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis are not recognized environmental conditions.

Regulatory Database Records Review

A records search was conducted to obtain and review records that would help evaluate RECs associated with the project area and surrounding properties. Environmental Data Resources (EDR®) performed a search of federal, tribal, state, and local databases regarding the project area and nearby properties. A review of the EDR® report indicates the project area is not listed on any federal, state or local databases.

Surrounding Properties

No surrounding or adjacent properties were identified in the Phase I ISA with potential to result in impacts on the project area. However, the Amador Community School Expansion facility is located adjacent to the southwestern side of the project area where NOA was identified as a substance of concern. A Removal Action Workplan was implemented in 2007, and a Removal Action Completion Report was approved by DTSC on April 13, 2009. This facility is not likely to negatively impact the project area; however, there is a potential for NOA to be present in the project area based on the proximity to this facility.
Preliminary Screen for Vapor Encroachment Conditions

WKA conducted a preliminary screening for vapor encroachment conditions (VEC) beneath the project area using the Tier 1 vapor encroachment screening evaluation. Based on the completion of the VEC-screening matrix, VEC does not or is not likely to exist in the project area.

**PROJECT IMPACTS**

Would the project:

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

[ ] Potentially Significant Impact  [x] Less Than Significant with Mitigation  [ ] Less Than Significant Impact  [ ] No Impact

**Discussion a):** The project would not change the amount or nature of vehicular travel through the project area; therefore, no additional hazardous materials would be used or transported above existing conditions during operation of the project.

During construction, hazardous materials, such as petroleum products (gasoline and oil) for construction equipment and concrete or asphalt for paving operations, would be transported, used, stored, and disposed of according to county, state, and federal regulations.

Because soil and rocks in the project area may contain NOA, there is potential that project construction could result in the exposure of residents and other sensitive receptors to dust from asbestos-containing rock and soils during earth moving activities. With the implementation of mitigation measure AIR-1 listed in Section 3. Air Quality, which requires an Asbestos Dust Control Plan to be approved by the Amador APCD and implemented throughout project construction in compliance with CARB’s NOA ACTM, dust with potential NOA would be controlled and contained during construction, reducing potential impacts to a level that is less than significant.

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

[ ] Potentially Significant Impact  [ ] Less Than Significant with Mitigation  [x] Less Than Significant Impact  [ ] No Impact

**Discussion b):** See Discussion a) above. The project consists of improvements to improve intersection safety. The project may involve the minor use of hazardous materials, including diesel fuel and other motor lubricants during construction. The use of these substances is not
expected to create a significant hazard to the public or the environment through reasonably foreseeable upset or accident. Therefore, impacts would be less than significant.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

☐ Potentially Significant Impact  ☒ Less Than Significant Impact  ☐ Less Than Significant with Mitigation  ☐ No Impact

Discussion c): The project area is approximately 500 feet from the Amador County School Expansion Facility (Shenandoah Valley Charter School/Amador Community School). During project operation, no additional hazardous materials would be used or transported above existing conditions.

The handling of hazardous materials associated with project construction would be conducted in compliance with county, state, and federal regulations, and, therefore, they would not pose a significant risk of release or contamination at the nearby school site.

Because soil and rocks in the project area may contain NOA, there is potential that project construction could result in the exposure of sensitive receptors to dust from asbestos-containing rock and soils during earth disturbance activities. With the implementation of mitigation measure AIR-1 listed in Section 3. Air Quality, which requires an Asbestos Dust Control Plan to be approved by the Amador APCD and implemented throughout project construction in compliance with CARB’s NOA ACTM, dust with potential NOA would be controlled and contained during construction, reducing potential impacts to a level that is less than significant.

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

☐ Potentially Significant Impact  ☐ Less Than Significant Impact  ☐ Less Than Significant with Mitigation  ☒ No Impact

Discussion d): According to the Phase I ISA completed for the project, the Amador County School Expansion Facility is located adjacent to the southwestern side of the project area, and is listed as California DTSC Cleanup Site because NOA was previously identified at the facility (Wallace Kuhl & Associates, 2015). County records indicate that a Removal Action Workplan was implemented at the facility in 2007, and a Removal Action Completion Report was approved by the DTSC on April 13, 2009. Therefore, the facility is not likely to adversely affect the project area. As stated previously, the project area has the potential to contain NOA, but it is not
Currently listed as a hazardous materials site compiled pursuant to Government Code Section 65962.5. Therefore, there would be no impact.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

[ ] Potentially Significant Impact  [ ] Less Than Significant with Mitigation  [ ] Less Than Significant Impact  [ ] No Impact

Discussion e): The project area is more than seven miles northwest of the nearest public airport, the Westover Field Amador County Airport (JAQ). The project area is not within JAQ’s airport influence area or within two miles of a public airport or public use airport. In addition, no vertical structures or sources of substantial light or glare would be included in the project that could result in airport safety hazards. Therefore, there would be no impact.

f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

[ ] Potentially Significant Impact  [ ] Less Than Significant with Mitigation  [ ] Less Than Significant Impact  [ ] No Impact

Discussion f): The project area is more than three miles northeast of the nearest private airstrip, Horse Shoe A Ranch Airport (CA71). No vertical structures or sources of substantial light or glare would be included in the project that could result in safety hazards; therefore, there would be no impact.

g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

[ ] Potentially Significant Impact  [ ] Less Than Significant with Mitigation  [ ] Less Than Significant Impact  [ ] No Impact

Discussion g): The Amador County Sheriff’s Office of Emergency Services is responsible for coordinating emergency response and evacuation procedures in the project area, and implementing the Amador County Evacuation Plan and Amador County Emergency Operations Plan. During project operation, implementation of emergency response and evacuation procedures would be expected to improve above existing conditions because the project would improve intersection safety and roadway geometrics by improving intersection visibility,
maximizing sight distance through the project area, and improving horizontal and vertical alignments.

During project construction, traffic flow along Shenandoah and Fiddletown Roads, and other nearby roadways, could be temporarily affected because of construction vehicles and equipment traveling along these roadways. However, roadways would remain open during construction, and the project would not be expected to substantially interfere with emergency response or evacuation. Therefore, impacts would be less than significant.

h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

- Potentially Significant Impact
- Less Than Significant with Mitigation
- Less Than Significant Impact
- No Impact

Discussion h): The project area is surrounded by agricultural and residential uses. The agricultural land adjacent to the project area is currently vegetated with annual grasses, and although this area is designated for agricultural uses, for the purposes of fire hazard analysis it is considered wildlands, and there is a risk for wildland fire in these areas. During project operation, operations along the roadway would remain similar to existing conditions, and the project would not result in additional heat sources or combustible materials in the project area. During project construction, wildland fires could result from sparks from construction equipment or use of other flammable materials. Fire hazards would be minimized through standard spark-preventing measures, such as using spark arresters, not driving onto dry grass, and other measures to control use of flammable materials. Therefore, impacts would be less than significant.

9. HYDROLOGY AND WATER QUALITY

REGULATORY SETTING

Federal Regulations

Federal Emergency Management Agency (FEMA)

FEMA administers the National Flood Insurance Program (NFIP) to provide subsidized flood insurance to jurisdictions that comply with FEMA regulations to limit development within floodplains. FEMA also prepares Flood Insurance Rate Maps (FIRMs) to identify areas subject to flooding. These FIRMs provide flood information and identify flood hazard zones. FEMA’s minimum level of flood protection for new development is the 100-year flood event, also described as a flood having a one percent chance of being equaled or exceeded in any given year with an average recurrence interval of 100 years.
Clean Water Act

U.S. EPA serves as the lead federal agency responsible for water quality management. The CWA of 1972 is the primary federal law that governs and authorizes water quality control activities by the U.S. EPA and individual states. Section 303 of the CWA requires individual states to adopt water quality standards for all surface waters of the U.S.

The NPDES permit program was established under Section 402 of the CWA to regulate municipal and industrial discharges to surface waters of the U.S. from municipal separate storm sewer systems (MS4s). Federal NPDES permit regulations have been established for a broad range of discharges, including point source municipal waste discharges and non-point source storm water runoff.

Safe Drinking Water Act

Under the Safe Drinking Water Act (Public Law 93-523), passed in 1974, the U.S. EPA regulates contaminants of concern to domestic water supply. Contaminants of concern relevant to domestic water supply are defined as those that pose a public health threat or that alter the aesthetic acceptability of the water. These types of contaminants are regulated by the U.S. EPA’s primary and secondary maximum contaminant levels (MCLs), which are applicable to treated water supplies delivered to a distribution system.

The U.S. EPA has delegated to the California Department of Public Health (CDPH) the responsibility for administering California’s drinking-water program. The CDPH is accountable to the U.S. EPA for program implementation and for adopting standards and regulations that are at least as stringent as those developed by the U.S. EPA. The applicable state primary and secondary MCLs are set forth in CCR, Title 22, Division 4, Chapter 15, Article 4.

State Regulations

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act) of 1969 is California’s statutory authority for the protection of water quality. Under the Porter-Cologne Act, the State must adopt water quality policies, plans, and objectives that protect the State’s waters for the use and enjoyment of its residents. The Porter-Cologne Act requires the State Water Resources Control Board (SWRCB) and its Regional Water Quality Control Boards (RWQCB) to adopt and periodically update water quality control plans (Basin Plans). Basin Plans are the regional water quality control plans required by both the CWA and Porter-Cologne Act, in which beneficial uses, water quality objectives, and implementation programs are established for each of the RWQCBs. The Porter-Cologne Act also requires waste dischargers to notify the RWQCBs of their activities through the preparation of Reports of Waste Discharge, and authorizes the SWRCB and its RWQCBs to issue and enforce waste discharge requirements, NPDES permits, Section 401 water quality certifications, and other approval actions.
In California, the SWRCB has broad authority over water quality control issues for the state. The SWRCB is responsible for developing statewide water quality policy and exercises the powers delegated to the State by the federal government under the CWA. Other state agencies with jurisdiction over water quality regulation in California include the California Department of Health Services for drinking water regulations, the California Department of Pesticide Regulation, the California Department of Fish and Wildlife, and the Office of Environmental Health and Hazard Assessment.

Regional authority for planning, permitting, and enforcement is delegated to the RWQCBs. The regional boards are required to formulate and adopt water quality control plans for all areas in the region and establish water quality objectives in those plans. Amador County is within the jurisdiction of the Central Valley RWQCB.

**NPDES Permit System and Waste Discharge Requirements for Construction**

The 1972 amendment to the CWA established the NPDES permit program. The NPDES permit program outlined in the CWA contains effluent limitation guidelines, water quality requirements, and permit program requirements for discharges to waters of the United States. The EPA has overall responsibility for the NPDES program, but administration of the program in California has been delegated to the SWRCB and the nine RWQCBs.

**Local Regulations**

**Amador County General Plan**

The County’s General Plan identifies the following policies and objective related to hydrology and water quality that are applicable to the project (Amador County, 1967):

- It is the policy of the County to:
  - a. Protect human life and health;
  - b. To minimize expenditure of public money for costly flood control projects;
  - c. To minimize the need for rescue and relief efforts associated with flooding and generally undertaken at the expense of the general public;
  - d. To minimize prolonged business interruptions
  - e. To minimize damage to public facilities and utilities such as water and gas mains, electric, telephone and sewer lines, streets and bridges located in areas of special flood hazards;
  - f. To help maintain a stable tax base by providing for the sound use and development of areas of special flood hazard so as to minimize future flood blight areas;
  - g. To insure that potential buyers are notified that property in an area of special flood hazards; and
Objective 1: To preserve, protect and where appropriate, promote the development of natural resources in water, mineral, timber, and soils resources.

Mokelumne/Amador/Calaveras (MAC) Integrated Regional Water Management (IRWM) Plan

The January 2013 IRWM Plan developed by the East Bay Municipal Utility District (EBMUD), includes the following policies for water resources:

- Maintain and improve water quality;
- Improve water supply reliability and ensure long-term balance of supply and demand;
- Practice resource stewardship; and
- Focus on areas of common ground and avoid prolonged conflict.

Amador County Stormwater Management Regulations

Title 15 of the County Code (“Buildings and Construction”) describes the County’s regulations, provisions, and ordinances for stormwater management and enforcement. The provisions include standards for erosion control during and post construction.

Chapter 15.40 (“Erosion Control Ordinance”) sets forth the County’s rules and regulations for review and permitting of excavation, grading, and earthwork construction, including fills and cuts, embankments and impoundment structures are required to be reviewed and permitted. This chapter establishes an administrative procedure for the issuance of required permits involving excavation, the approval of plans and inspection of all permitted excavation, and the establishment of measures to control erosion and other adverse impacts of excavation. Chapter 17.48 sets forth standards for drainage facilities, and Section 17.90.120 “Drainage Standards” includes standards for streets and roads. The County’s Public Works Department has jurisdiction over the permitting, inspecting, and enforcing of erosion control measures and grading permits (Ord. 1619 §2(part), 2005).

AFFECTED ENVIRONMENT

The project area is within the Cosumnes Subbasin, which lies within the San Joaquin Valley Groundwater Basin (SJVGB). The Cosumnes Subbasin is bounded on the south and southwest by the Eastern San Joaquin Subbasin and on the north to northwest by the South American Subbasin of the SJVGB. The Cosumnes Subbasin drains westward through the Cosumnes River on the north, Dry Creek in the approximate center of the subbasin, and the Mokelumne River on the south. Camanche Reservoir is located along a portion of the Mokelumne River in the southeast part of the subbasin.

Annual precipitation (rainfall and snowfall) is extremely variable in the project area. Within a given year, precipitation is highly seasonal with most precipitation normally occurring between November and May, and very little occurring between late spring and fall. Peak flows in the area
streams and rivers normally occur during winter storms or during the spring snow-melt season from March through June. River and stream flows decrease to a minimum in late summer or fall.

Groundwater in most of the County is not well defined. The majority of available groundwater is transient and found in fractured rock. Groundwater quantity and quality in the region varies greatly from well site to well site due to the small and unpredictable yields of the fractured rock system that typifies the foothill geology (Amador County, 2007).

There are no water bodies or other aquatic resources within or adjacent to the project area. There are intermittent roadside drainage ditches located adjacent to Shenandoah Road and Fiddletown Road, including two corrugated metal pipe culverts that convey water from north to south under Shenandoah Road, west of the intersection. These roadside drainage ditches convey water in a generally downhill, northeast to south/southwest direction. Drainages terminate in an isolated ditch on the vineyard parcel south of Shenandoah Road, where storm water percolates into the ground; therefore, roadside drainages in the area do not have connectivity to other drainage systems or waterways.

According to FEMA, the project area is located in Zone X, an area that is outside the Special Flood Hazard Area subject to inundation by the 100-year flood (FEMA, 2008).

**PROJECT IMPACTS**

Would the project:

a) **Violate any water quality standards or waste discharge requirements?**

- [ ] Potentially Significant Impact
- [ ] Less Than Significant with Mitigation
- [x] Less Than Significant Impact
- [ ] No Impact

**Discussion a):** There are no waste discharge requirements applicable to the project area, as the project area includes a roadway where no wastewater is discharged. During construction, water quality impacts could result from ground disturbance activities because soil and other debris could be carried away by storm water runoff, resulting in degraded water quality. Project construction would be subject to the requirements of the NPDES permit required for the project, which requires implementation of BMPs to minimize soil erosion and protect water quality. Typical BMPs include, but are not limited to, limiting the construction area to the smallest area required to complete construction; dust control measures, such as watering exposed soils; and use of silt fencing, fiber rolls, and sheeting to contain soils on site during storm events. Following construction, exposed soils would either be paved or be stabilized through compaction and/or new vegetation. With implementation of standard BMPs and compliance with the NPDES requirements, the project would not be expected to violate water quality standards.
Existing roadside drainages would be realigned along with the new intersection and approach roadway locations; however, after project implementation, storm water drainage patterns in the project area would remain largely unchanged from existing conditions. Storm water would continue to be conveyed downhill where it would terminate in the existing isolated drainage ditch on the vineyard parcel south of Shenandoah Road, where storm water would percolate into the soil.

The project would not result in any new connections to downstream waterways.

Also, because the project would not increase the number of traffic lanes through the area, or increase the number of vehicles using the intersection, the project would not result in an increase in pollutants (oil, dirt, etc.) from roadway use beyond existing conditions; therefore, impacts would be less than significant.

b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

- Potentially Significant Impact
- Less Than Significant with Mitigation
- X Less Than Significant Impact
- No Impact

Discussion b): The project would not require excavation that would have the potential to reach groundwater. The project would increase the amount of impervious surface in the project area slightly; however, this additional area would not be large enough to substantially interfere with groundwater recharge. In addition, the new impervious areas would be surrounded by natural surfaces and vegetation. Surface waters running off of paved areas would percolate into the surrounding subsurface soils, and eventually into the groundwater supply. Therefore, impacts would be less than significant.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

- Potentially Significant Impact
- Less Than Significant with Mitigation
- X Less Than Significant Impact
- No Impact

Discussion c): The project would include intersection improvements and realignment resulting in a slight increase in impervious surfaces within the project area; however, drainage patterns in the project area would remain similar to existing conditions, and no substantial erosion or siltation would result on site or off site; therefore, impacts would be less than significant.
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

☐ Potentially Significant Impact  ☐ Less Than Significant with Mitigation  ☒ Less Than Significant Impact  ☐ No Impact

Discussion d): The project would result a slight increase in the amount of impervious surfaces within the project area, which could result in increased storm water runoff. However, drainage patterns in the project area would remain similar to existing conditions, and the project would be designed to accommodate anticipated runoff levels as required by standard design guidelines used by the County; therefore, no flooding would be expected to result on site or off site, and, impacts would be less than significant.

e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

☐ Potentially Significant Impact  ☐ Less Than Significant with Mitigation  ☒ Less Than Significant Impact  ☐ No Impact

Discussion e): While the project would increase the impervious surface in the area slightly, which could result in a small increase in stormwater runoff, the project would be designed to accommodate existing and anticipated runoff levels as required by standard design guidelines used by the County. Also, because the project would not increase the number of traffic lanes through the area, or increase the number of vehicles using the intersection, the project would not result in an increase in pollutants (oil, dirt, etc.) from roadway use beyond existing conditions. Therefore, impacts would be less than significant.

f) Otherwise substantially degrade water quality?

☐ Potentially Significant Impact  ☐ Less Than Significant with Mitigation  ☒ Less Than Significant Impact  ☐ No Impact

Discussion f): See Discussion a) above. The project design, as well as compliance with all federal, state, and local regulations regarding water quality standards, would ensure that the project would not substantially degrade water quality. Therefore, impacts would be less than significant.

g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

Shenandoah Road/Fiddletown Road Intersection Improvement Project  Amador County
Initial Study/Mitigated Negative Declaration  December 2015
**Discussion g):** The project would not include residential dwellings. In addition, according to FEMA, the project area is located in Zone X, an area that is outside the Special Flood Hazard Area subject to inundation by the 100-year flood (FEMA, 2008). Therefore, there would be no impact.

**h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?**

**Discussion h):** The project would not include structures that would impede or redirect flows. In addition, according to FEMA, the project area is located in Zone X, an area that is outside the Special Flood Hazard Area subject to inundation by the 100-year flood (FEMA, 2008). Therefore, there would be no impact.

**i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?**

**Discussion i):** The project would not increase risk of flooding from levee or dam failure, because there are no dams or levees in proximity to the project area. The nearest dam to the project area is the Pardee Dam, approximately 14 miles south of the project area. Also, the reconfigured roadside drainage ditches would be designed with sufficient capacity such that no flooding would result, and no people or structures would be exposed to risks of loss, injury, or death involving flooding. Therefore, there would be no impact.

**j) Inundation by seiche, tsunami, or mudflow?**

**Discussion j):** The project would not increase risk of flooding from levee or dam failure, because there are no dams or levees in proximity to the project area. The nearest dam to the project area is the Pardee Dam, approximately 14 miles south of the project area. Also, the reconfigured roadside drainage ditches would be designed with sufficient capacity such that no flooding would result, and no people or structures would be exposed to risks of loss, injury, or death involving flooding. Therefore, there would be no impact.
**Discussion j):** A tsunami is a large ocean wave associated with a seismic event; and a mudflow is the rapid, downhill movement of a large mass of mud formed from loose soil and water. The project area is not in proximity to the ocean and would therefore not be impacted by tsunamis. In addition, the project area and vicinity is not located in an area that is at risk for mudflows.

A seiche is an oscillation of a land-locked water body, such as a lake or dam, typically caused by strong winds and rapid changes in atmospheric pressure. There are no land-locked waterways located in or adjacent to the project area. Therefore, there would be no impact from risk of tsunami, mudflows, or seiche.

**10. LAND USE AND PLANNING**

**REGULATORY SETTING**

**State Regulations**

California Government Code Section 65300, et seq. establishes the obligation of cities and counties to adopt and implement general plans. The general plan is a comprehensive, long-term, and general document that describes plans for the physical development of a city or county and of any land outside its boundaries that, in the City’s or County’s judgment, bears relation to its planning. The general plan addresses a broad range of topics, including at a minimum, land use, circulation, housing, conservation, open space, noise, and safety. In addressing these topics, the general plan identifies the goals, objectives, policies, principles, standards, and plan proposals that support the city’s or county’s vision for the area.

The State Zoning Law (California Government Code Section 65800, et seq.) establishes that zoning ordinances, which are laws that define allowable land uses within a specific zone district, are required to be consistent with the general plan.

**Local Regulations**

The County’s General Plan identifies the following objectives and policies related to land use and planning (Amador County, 1967):

**Objectives:**

- **Objective 1:** To preserve, protect and where appropriate, promote the development of natural resources in water, minerals, timber and soils resources.

- **Objective 6:** To provide and maintain rural and urban services and facilities of high quality for adequate health, safety and comfort, and educational, cultural and recreational facilities for the public benefit and enjoyment.

**Policies:**

- **Compatibility of Land Uses:** Urban, Residential, Industrial, Agricultural and Recreational, will be fostered and encouraged. All future reservoir sites, prime farmland, or commercial grade
timber land, or areas of outstanding scenic or recreational significance shall be preserved against subdivision or other urban development, and zoned to preserve their present use and value.

**Affected Environment**

The County’s current land use pattern is comprised of large areas of forest land, agriculture (including crops and livestock), rural residences, industrial and mining/mineral resource extraction, and a number of unincorporated communities that have a mixture of land uses, including commercial, industrial, and residential uses. Land use designations in the project area include County ROW and Agricultural General. The zoning designations in the project area include County ROW and AG (Exclusive Agriculture).

APN 008-030-016, in the northwest portion of the project area, is under a conservation easement held by the Mother Lode Land Trust (MLLT). According to the MLLT, a conservation easement is:

A voluntary, negotiated legal agreement between a landowner and the land trust. Conservation easements protect agricultural, scenic, historic, and archaeological values, and wildlife habit by placing permanent restrictions on the future use of the land. The restrictions are dependent on the conservation goals and tailored to the needs and desires of each landowner. The landowner retains fee title to the property and can sell, devise, or otherwise transfer title to the land, subject only to the terms of the conservation easement. Public access is not granted unless the landowner requests that option. The land trust is charged with monitoring the property to ensure that the conservation values are being protected and the terms of the conservation easement upheld.

The MLLT conservation easement was recorded in 1997. As described in the recorded easement document, the MLLT conservation easement is intended to “preserve the Property in its current agricultural, scenic, open space, wildlife and wooded wildlife habitat condition in perpetuity, and to protect it from any use that will significantly impair or interfere with its Agricultural and Conservation Values.” The easement lists several restrictions on activities or uses of the parcel that would be inconsistent with the purpose and intent of the easement. The list of prohibited uses does not include use of a portion of the parcel for a public roadway.

**Project Impacts**

Would the project:

a) Physically divide an established community?
Discussion a): The project would include improvements to an existing roadway intersection located just northeast of the city limits of Plymouth. The project would realign the intersection and approach roadway. The project does not consist of features that would physically disrupt or divide an established community. Due to its location outside the city of Plymouth, no established neighborhoods would be divided. Therefore, there would be no impact.

b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Discussion b): There are no land use plans, policies, or regulations that have been adopted for the project area for the purpose of avoiding or mitigating an environmental effect; therefore, there would be no impact.

c) Conflict with any applicable habitat conservation plan or natural community conservation plan?

Discussion c): There are no habitat conservation plans or natural community conservation plans that are applicable to the project area; therefore, there would be no impact.

11. MINERAL RESOURCES

REGULATORY SETTING

Local Regulations

The County’s General Plan identifies the following policies related to mineral resources (Amador County, 1967):
• Mineral deposits identified as being of regional or statewide significance will be protected using compatibility criteria developed by the State Mining and Geology Board and the regulatory authority of general plans contained in the State Planning and Zoning Act.

• Where feasible, Amador County will utilize guidelines prepared by the State Mining and Geology Board for compatibility of land uses near areas designated as mineral resource zones (MRZ) in the Amador County General Plan.

**Affected Environment**

The primary mineral resources in the county are copper, zinc, silver and gold. The CDOC identifies a portion of the project area as being within Mineral Resource Zone 3a (MRZ-3a). MRZ-3a is defined as areas “considered to have a moderate potential for the discovery of economic mineral deposits.”

**Project Impacts**

Would the project:

a) **Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?**

☐ Potentially Significant Impact ☐ Less Than Significant with Mitigation ☐ Less Than Significant Impact ☒ No Impact

**Discussion a):** According to the County’s General Plan, mineral resources near the project area are gold and limestone. There are abandoned mines located near the project area (Amador County, 1967). Some areas adjacent to the project area would be excavated between 5 to 25 feet deep. However, the project is limited to intersection improvements and would not extract mineral resources from the project area, or significantly limit access to mineral resources that may be in the area. Therefore, the project is not expected to result in the loss of availability of any nearby mineral resources, and there would be no impact.

b) **Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?**

☐ Potentially Significant Impact ☐ Less Than Significant with Mitigation ☐ Less Than Significant Impact ☒ No Impact

**Discussion b):** See response a) above. The project is limited to intersection improvements and would not result in the loss of availability of a locally-important mineral resource recovery site.
delineated on a local general plan, specific plan or other land use plan. Therefore, there would be no impact.

12. NOISE

REGULATORY SETTING

The County’s General Plan addresses noise sources, acceptable noise levels for various land uses, and abatement measures, which states, “noise levels contributed by a proposed noise generating project to adjoining properties identified by the County as being noise sensitive shall not raise the existing ambient noise level at the property line beyond the following levels unless a statement of overriding considerations has been adopted pursuant to Section 15093 of the State CEQA Guidelines or other acceptable mitigation measures have been incorporated into the project” (Amador County, 1988). The levels referred to in the General Plan are shown in Table 1 below. The noise levels are described in terms of Ldn, which is the adjusted average of sound level over a 24-hour day.

TABLE 1: ALLOWABLE SOUND LEVEL INCREASE

<table>
<thead>
<tr>
<th>Existing Ambient Noise Level</th>
<th>Allowed Increase</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ldn 55 dBA</td>
<td>Ldn 3 dBA</td>
</tr>
<tr>
<td>Ldn 60 dBA</td>
<td>Ldn 2 dBA</td>
</tr>
<tr>
<td>Ldn 65 dBA</td>
<td>Ldn 1 dBA</td>
</tr>
</tbody>
</table>

Source: Amador County, 1988
Notes: A-weighted decibels (dBA) are a common unit of sound level. Ldn is the Day-Night Sound Level, an adjusted average A-weighted sound level for a 24-hour day, which is calculated by adding a 10-dBA adjustment to sound levels during nighttime hours (10:00 p.m. to 7:00 a.m.). This adjustment compensates for the increased sensitivity to noise during the typically quieter nighttime hours.

The County does not have a noise ordinance that regulates construction noise. Caltrans Standard Specifications Section 14-8.02 requires that noise levels from construction between the hours of 9:00 p.m. and 6:00 a.m. not exceed 86 A-weighted decibels (dBA) at a distance of 50 feet from the construction area.

AFFECTED ENVIRONMENT

Existing noise sources in the project area and vicinity are predominantly from vehicle traffic along Shenandoah Road and Fiddletown Road, agricultural activities (e.g., vineyard operations,) and natural noise sources. (e.g., animals, wind, etc.). Traffic levels in the project area are relatively low, with an estimated Average Daily Traffic (ADT) count of less than 2,000 vehicles per day. Because traffic is the dominant noise source, ambient noise levels are assumed to be the highest during the peak traffic hours, generally between 7:00 a.m. to 9 a.m. The only
sensitive noise receptor near the project area is Shenandoah Valley Charter School, located approximately 500 feet west of the westernmost edge of the project area, and more than 1,200 feet west of the center of the existing intersection.

**PROJECT IMPACTS**

Would the project result in:

a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

- [ ] Potentially Significant Impact
- [x] Less Than Significant with Mitigation
- [ ] Less Than Significant Impact
- [ ] No Impact

**Discussion a):** The project would maintain the same number and width of through lanes (one lane in each direction) and would not increase capacity, result in additional vehicles on the roadway, or move traffic closer to sensitive noise receptors. Therefore, operation of the project would not change the existing noise environment in the project vicinity.

Construction activities for the project could result in short-term and intermittent increases in noise levels in the project area. Noise levels would vary depending on construction activity, equipment type, duration of use, and the distance between noise source and receiver. Typical sound emission characteristics of construction equipment that may be used during project construction are provided in Table 2 below. The noise levels are described in terms of Lmax, which is the maximum sound level of a particular noise event.

**TABLE 2: CONSTRUCTION EQUIPMENT NOISE LEVELS**

*Source: U.S. Department of Transportation, Federal Highway Administration, 2011
Notes: The noise levels shown above are actual, measured noise levels based on measurements performed for the Central Artery/Tunnel Project. Noise measurements were averaged to compute the actual emission level.*
Noise produced by construction equipment decreases at a rate of about 6 dBA per doubling of
distance from the source. The closest noise sensitive receptor, the Shenandoah Valley Charter
School/Amador Community School, is approximately 500 feet west of the project area at its
closest point; therefore, the noise levels shown in Table 2 above would be reduced by at least
18 dBA at the school (with at least three doublings of distance). In addition, standard building
construction with the windows closed provides approximately 20 to 25 dBA of noise reduction in
interior spaces. Therefore, potential construction noise inside the school buildings would be
approximately 38 to 43 dBA lower than what is shown in Table 2 above. While actual noise
levels may vary depending on the type and number of equipment pieces used and the duration
of use, based on the distance of the project area from the school, it is anticipated that
construction activities would not result in substantial levels of noise at the school.

Construction activities would be short-term and intermittent, and project construction would be
conducted in compliance with Caltrans Standard Specifications Section 14-8.02, which would
minimize potential impacts. Therefore, impacts would be less than significant.

b) Exposure of persons to or generation of excessive groundborne vibration or groundborne
noise levels?

Discussion b): Groundborne vibration results from sound waves radiating through the ground.
The sound caused by groundborne vibration is called groundborne noise. The ground motion
caued by groundborne vibration is measured as peak particle velocity (PPV) in inches per
second, and groundborne noise is measured as vibration decibels (Vdb). Typical outdoor sources
of perceptible groundborne vibration and noise are construction equipment and traffic on rough
roads.

The Federal Transit Administration (FTA) has published standard vibration level and peak
particle velocities for construction equipment operations. The calculated root mean square
(RMS) velocity level expressed in Vdb and PPV for construction equipment at distances of 25, 50,
and 100 feet are listed below in Table 3.

<table>
<thead>
<tr>
<th>Equipment</th>
<th>PPV at 25 feet (ft.) in inches per second (in/sec)</th>
<th>RMS at 25 ft. (Vdb)</th>
<th>PPV at 50 ft. (in/sec)</th>
<th>RMS at 50 ft. (Vdb)</th>
<th>PPV at 100 ft. (in/sec)</th>
<th>RMS at 100 ft. (Vdb)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loaded Truck</td>
<td>0.0760</td>
<td>86</td>
<td>0.0269</td>
<td>77</td>
<td>0.0095</td>
<td>68</td>
</tr>
</tbody>
</table>
The FTA uses a PPV of 0.2 inch per second as the vibration damage threshold for fragile buildings and a PPV of 0.12 inch per second for extremely fragile historic buildings. The FTA criterion for infrequent groundborne noise events (fewer than 30 events per day) that may cause annoyance are 80 Vdb for residences and other buildings where people normally sleep. While this project is not a transit project being proposed by the FTA, these FTA thresholds are being used for this analysis as a comparison to the FTA-published vibration levels for construction equipment.

The project would maintain the same number of through lanes (one in each direction), would not increase capacity or result in additional vehicles on the roadway, and would not bring traffic closer to adjacent noise receptors. Therefore, operation of the project would not change the existing groundborne vibration or noise levels in the project vicinity.

As shown in Table 3, the groundborne vibration level of construction equipment would be below the most conservative FTA damage threshold of 0.12 inch per second PPV for extremely fragile historic buildings at a distance of 25 feet from the project area; therefore, buildings near the project area would not be damaged by construction-generated groundborne vibration. The only sensitive noise receptor near the project area is the Shenandoah Valley Charter School/Amador Community School located approximately 500 feet west of the project area. Based on the distance of the school from the project area, it is unlikely that the school would be exposed to groundborne noise levels above the FTA threshold of 80 Vdb for annoyance to residences and other buildings.

It is expected that groundborne vibration and noise from project construction would be intermittent and would be localized near the project area. In addition, project construction would comply with Caltrans Standard Specifications Section 14-8.02, which requires that noise levels from construction between the hours of 9:00 p.m. and 6:00 a.m. not exceed 86 dBA at a distance of 50 feet from the construction area. Compliance with these regulations would minimize potential impacts. Therefore, impacts would be less than significant.

c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

- Potentially Significant Impact
- Less Than Significant with Mitigation
- Less Than Significant Impact
- No Impact

Discussion c): See Discussion a) above.

---

Shenandoah Road/Fiddletown Road Intersection Improvement Project  
Amador County  
Initial Study/Mitigated Negative Declaration  
December 2015
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

☐ Potentially Significant Impact  ☐ Less Than Significant with Mitigation  ☒ Less Than Significant Impact  ☐ No Impact

Discussion d): See Discussion a) above.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

☐ Potentially Significant Impact  ☐ Less Than Significant with Mitigation  ☐ Less Than Significant Impact  ☒ No Impact

Discussion e): The project area is more than seven miles northwest of the nearest public airport, the Westover Field Amador County Airport (JAQ). The project area is not within JAQ’s airport influence area or within two miles of a public airport or public use airport; therefore, there would be no impact.

f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

☐ Potentially Significant Impact  ☐ Less Than Significant with Mitigation  ☐ Less Than Significant Impact  ☒ No Impact

Discussion f): The project area is more than three miles northeast of the nearest private airstrip, Horse Shoe A Ranch Airport (CA71). The project area is not near a private airstrip and would not expose people to excessive noise levels; therefore, there would be no impact.

13. POPULATION AND HOUSING

REGULATORY SETTING

No federal, state or local plans, policies, regulations, or laws related to population and housing are applicable to the project.

AFFECTED ENVIRONMENT

The project area is surrounded mostly by agricultural land uses and a school approximately 500 feet to the west. Residential uses in the project vicinity are located along Burke Drive.
approximately 0.33 mile to the west, along Shenandoah Road approximately 0.47 mile to the north, and in the City of Plymouth adjacent and to the west.

Would the project:

a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

☐ Potentially Significant Impact ☐ Less Than Significant with Mitigation ☐ Less Than Significant Impact ☒ No Impact

Discussion a): The project would not include new homes or businesses, or extend the roadway or other infrastructure within the project area. Shenandoah Road and the Shenandoah Road/Fiddletown Road intersection would be realigned to improve intersection safety; however the project would not include any improvements that would induce population growth in the area. Therefore, there would be no impact.

b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

☐ Potentially Significant Impact ☐ Less Than Significant with Mitigation ☐ Less Than Significant Impact ☒ No Impact

Discussion b): The project would not displace people or housing; therefore, there would be no impact.

c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

☐ Potentially Significant Impact ☐ Less Than Significant with Mitigation ☐ Less Than Significant Impact ☒ No Impact

Discussion c): See Discussion b) above.

14. PUBLIC SERVICES

Regulatory Setting

No federal, state or local plans, policies, regulations, or laws related to public services are applicable to the project.

Shenandoah Road/Fiddletown Road Intersection Improvement Project
Initial Study/Mitigated Negative Declaration
Amador County
December 2015

Page 82
**Affected Environment**

The Amador Fire Protection District (AFPD) is responsible for providing emergency medical services in the project area. The AFPD’s service area encompasses approximately 491 square miles, mostly within unincorporated areas of the County. Emergency response time standards vary by area; the response time guideline established by the California Emergency Medical Services (EMS) Agency is five minutes in urban areas, 15 minutes in suburban or rural areas, and as quickly as possible in wilderness areas. According to the AFPD, their average response time is approximately 7.4 minutes (Amador County Fire Protection District, 2015). The nearest fire stations to the project area are Station No. 122, located approximately 0.92 mile to the west, and Station No. 123, approximately 4.43 miles to the east.

The County Sheriff’s Office provides law enforcement services to the project area, and unincorporated areas of the county and surrounding communities. According to the Sheriff’s Office, there are approximately 27 deputies assigned to their Patrol Bureaus who patrol the larger portion of the 592 square miles of land and the 12 square miles of water in the service area. The Patrol Bureau operates six patrol beats throughout the county (Amador County Sheriff’s Department, 2015).

The Amador County Unified School District (ACUSD) provides Kindergarten through 12th grade education to students living in the county. The ACUSD currently operates 13 schools throughout the county, including two high schools, one continuation high school, one independent study, two junior high schools, and six elementary schools, as well as a County Office of Education. The ACUSD had a 2012–2013 school year enrollment of 3,884 students.

According to the Amador County Park and Recreation Master Plan, excluding the 652 square miles of land in the county that is occupied by the El Dorado National Forest, there are 278 acres of land that is used for urban recreation and open space purposes. Many of the 30 urban parks offer limited recreational opportunities. In 2012, the Amador County Recreation Agency (ACRA) adopted a policy requiring provision of five acres of parkland for every 1,000 residents.

**Project Impacts**

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

i) Fire protection?

ii) Police protection?

iii) Schools?

iv) Parks?
v) Other public facilities?

☐ Potentially Significant Impact  ☐ Less Than Significant with Mitigation  ☐ Less Than Significant Impact  ☒ No Impact

**Discussion a) i) – v)**: The project is limited to improvements to an existing intersection. The project would not adversely impact fire protection services, response times, or personnel and facility requirements, or increase demand for police protection services. The project would not involve the development of residential dwellings or otherwise contribute to an increase in the school-aged child population, necessitating the construction or expansion of schools. The project would not create new housing units or induce population growth due to employment, which would result in the need for new or expanded parks or other public facilities. Therefore, there would be no impact.

### 15. RECREATION

**REGULATORY SETTING**

**Amador County General Plan**

The following objective in the County’s General Plan is relevant to the project (Amador County, 1967):

- Objective A: To utilize the outstanding natural recreational assets of the County to the fullest reasonable extent; to recognize and fulfill the various recreational needs of all local residents and visitors; to coordinate the recreation plans of federal, state, local governmental, public and strict utility agencies; to recognize and encourage the role of private enterprise in recreation activities; and to utilize such financial assistance as may be available to the County from federal, state, and other sources in the accomplishment of elements of the plan.

**Amador County Recreation Master Plan**

In 2006, the County Recreation Agency developed a Recreation Master Plan, which provides the foundation for a park and recreation program for the residents of the county. The Recreation Master Plan also identifies existing deficiencies and future recreational and park needs.

**AFFECTED ENVIRONMENT**

According to the County Recreation Agency, the five cities and the County are the primary providers of urban park and recreational facilities in the region. The Bureau of Land Management (BLM) manages small parcels throughout the county, but most are not designated for recreational purposes. The El Dorado National Forest offers a wide range of activities,
including camping, hiking, skiing, boating, and wilderness areas. The forest contains about 652 square miles of land.

The project area primarily includes open grass lands with oak trees. There are vineyards and agricultural facilities adjacent to the project area, south of Fiddletown Road. Shenandoah Valley Charter School/Amador Community School is approximately 500 feet west of the project area. According to the County’s Geographic Information Systems Land Use Viewer, there are no parks in or near the project area. According to the USFWS, the nearest wildlife refuge is the Stone Lakes National Wildlife Refuge, located more than 35 miles southwest of the project area, and the nearest park is Main Street Park, located less than one mile to the west in the city of Plymouth.

**PROJECT IMPACTS**

Would the project:

a) **Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?**

- [ ] Potentially Significant Impact
- [ ] Less Than Significant with Mitigation
- [ ] Less Than Significant Impact
- [x] No Impact

**Discussion a):** The project would not create new housing units or induce new population growth, which would accelerate the deterioration of existing parks or recreational facilities; therefore, there would be no impact.

b) **Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?**

- [ ] Potentially Significant Impact
- [ ] Less Than Significant with Mitigation
- [ ] Less Than Significant Impact
- [x] No Impact

**Discussion b):** The project would not create new housing units or induce new population growth that would require the expansion or construction of recreational facilities; therefore, there would be no impact.
16. TRANSPORTATION AND TRAFFIC

REGULATORY SETTING

Federal Regulations

Federal Highway Administration’s Highway Safety Improvement Program (HSIP)

The goal of the program is to achieve a significant reduction in traffic fatalities and serious injuries on all public roads, including non-State-owned public roads and roads on tribal lands. The HSIP requires a data-driven, strategic approach to improving highway safety on all public roads.

Local Regulations

Amador County General Plan, Circulation Element

The following objective is applicable to the project:

- To encourage major state and federal water development, transportation, and other projects which will assist in the accomplishment of the foregoing.

Amador Countywide Pedestrian and Bicycle Transportation Plan

The Amador Countywide Pedestrian and Bicycle Transportation Plan was developed to improve pedestrian and bicycle access for residents and visitors of the county. The Plan also serves as a countywide Americans with Disabilities Act (ADA) transition plan for public rights of way. The following goal is applicable to the project:

- To develop a safe, functional and convenient non-motorized transportation network throughout Amador County that addresses the mobility needs of pedestrians and bicyclists in a manner than enhances community identity and livability.

Amador County Long Range Transit Development Plan

The Amador County Transportation Commission (ACTC) has initiated a Long Range Transit Development Plan to consider the long-range impact of the changing community and how these changes will impact the large-scale transit needs within the region in the coming decades. Rather than focusing on short-range operating details, this study takes a long view of changes likely to occur in the community, including planned developments and transportation infrastructure changes, population projections, and employment development prospects, and evaluates the need for transit services and transit infrastructure.

Amador Countywide Regional Transportation Plan (RTP)

The RTP is a multi-modal, long-range planning document prepared by the ACTC. The current 2004 RTP includes programs and policies for congestion management, transit, bicycles and pedestrians, roadways, freight, and constrained financing.
AFFECTED ENVIRONMENT

Transportation Network

The roadway network that serves the county consists of Arterials, Major Collectors, Minor Collectors, and Local Roads. The county Arterials are all state highways, including SR 16, SR 26, SR 49, SR 88, and SR124. There are no freeways in the county. The roadway network that serves the project area consists of Shenandoah Road and Fiddletown Road, which are both identified as Major Arterials. The project area is not currently served by a public transportation or bus system.

Bicycle and Pedestrian Facilities

The project area is currently not served by a pedestrian or bicycling system, as indicated in the Amador Countywide Pedestrian and Bicycle Transportation Plan.

PROJECT IMPACTS

Would the project:

a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

- Potentially Significant Impact
- Less Than Significant with Mitigation
- Less Than Significant Impact
- No Impact

Discussion a): During operation, the project would maintain the same number of through lanes (one in each direction) and would not increase capacity or result in additional vehicles on the roadway. Short-term construction traffic would primarily include limited numbers of construction personnel commuting to and from the project area. Construction activities associated with construction of the project would be expected to last approximately six months. The roadway would remain open during construction; however, traffic flow could be temporarily affected by slight delays or slightly increased travel time from construction vehicles and activities in the project area. Traffic flow would be restored to existing conditions after construction is complete. Therefore, impacts would be less than significant.

b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?
Potentially Significant Impact ☐ Less Than Significant with Mitigation ☐ Less Than Significant Impact ☒ No Impact

Discussion b): The project would maintain the same number of through lanes (one in each direction) and would not increase capacity or result in additional vehicles on the roadway; therefore, the project would have no impact on existing traffic operations, and there would be no impact.

c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Potentially Significant Impact ☐ Less Than Significant with Mitigation ☐ Less Than Significant Impact ☒ No Impact

Discussion c): The project area is approximately five miles northeast of Westover Field Airport. The project would not result in an increase in air traffic levels or change in location of air traffic. The project would not include any vertical structures or sources of substantial light or glare that could affect air traffic. Therefore, there would be no impact.

d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Potentially Significant Impact ☐ Less Than Significant with Mitigation ☒ Less Than Significant Impact ☐ No Impact

Discussion d): The purpose of the project is to improve traffic safety through the project corridor by realigning the intersection, increasing visibility, enhancing signage, and installing traffic control improvements. The project would not increase hazards because of a design feature or incompatible use, and is expected to improve the safety of the intersection. Therefore, impacts would be less than significant.

e) Result in inadequate emergency access?

Potentially Significant Impact ☐ Less Than Significant with Mitigation ☒ Less Than Significant Impact ☐ No Impact

Discussion e): The project does not include any elements that would impede emergency access to or from the project area. Traffic flow at the intersection could be temporarily affected during
project construction. However, the intersection would remain open during construction, and emergency vehicles would continue to have access through the area. Following construction, emergency access would be improved with the enhanced traffic safety at the intersection. Therefore, impacts would be less than significant.

f) Conflict with adopted policies, plans or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

- Potentially Significant Impact
- Less Than Significant with Mitigation
- Less Than Significant Impact
- No Impact

Discussion f): There are no bicycle or pedestrian facilities in the project area, and no transit or bus routes currently run through the project area. Therefore, there would be no impact.

17. UTILITIES AND SERVICE SYSTEMS

REGULATORY SETTING

Federal and State Regulations

No federal or state plans, policies, regulations, or laws related to utilities and service systems are applicable to the project. However, the following local ordinance is applicable to the project:

Local Regulations

Amador County Stormwater Management Regulations

Title 15 of the County Code ("Buildings and Construction") describes the County’s regulations, provisions, and ordinances for stormwater management and enforcement. The provisions include standards for erosion control during and post construction.

AFFECTED ENVIRONMENT

The project area lies within the Amador Water Agency (AWA), which provides the entire county with water and wastewater services. The Amador Water Service (AWS) provides water to the county through surface and groundwater supplies. ACES Waste Services provides waste disposal services to the county and project area.

PROJECT IMPACTS

Would the project:

a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board (RWQCB)?
Discussion a): The project would not involve the development of residential dwellings or any other facilities that would contribute to an increase in the amount of wastewater generated. The project is limited to existing intersection improvements, focusing on the safety of the intersection. Therefore, there would be no impact.

b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Discussion b): See Discussion a) above. The project would not involve the development of residential dwellings or any other facilities that would contribute to an increase in the amount of wastewater generated. Therefore, there would be no impact.

c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Discussion c): The project would result in a slight increase in impervious surfaces within the project area, which could result in small amounts of increased stormwater runoff. Additionally, existing roadside stormwater drainages would need to be realigned to conform to the realigned intersection and roadway approaches. However, drainage patterns would remain similar to existing conditions, and the project would be designed to accommodate existing and anticipated runoff levels as required by standard design guidelines used by the County.

Project construction would comply with the requirements of the NPDES permit required for the project, which requires implementation of BMPs to minimize soil erosion and protect water quality. Typical BMPs include, but are not limited to, limiting the construction area to the smallest area required to complete construction; dust control measures, such as watering exposed soils; and use of silt fencing, fiber rolls, and sheeting to contain soils on site during storm events. Following construction, exposed soils would either be paved or be stabilized.
through compaction and/or new vegetation. With implementation of standard BMPs and compliance with the NPDES requirements, the project would not be expected to result in substantial water quality impacts, requiring the need for new or expanded storm water drainage facilities. Therefore, impacts would be less than significant.

d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

☐ Potentially Significant Impact ☐ Less Than Significant with Mitigation ☒ Less Than Significant Impact ☐ No Impact

Discussion d): The project may require minimal amounts of water during construction (for mixing cement or watering areas to stabilize loose soils) or during operation (for routine cleaning of the roadway). However, the project would not be expected to require the need for new or expanded entitlements; therefore, impacts would be less than significant.

e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project’s projected demand in addition to the provider’s existing commitments?

☐ Potentially Significant Impact ☐ Less Than Significant with Mitigation ☐ Less Than Significant Impact ☒ No Impact

Discussion e): The project would not require any wastewater treatment; therefore, there would be no impact.

f) Be served by a landfill with sufficient permitted capacity to accommodate the project’s solid waste disposal needs?

☐ Potentially Significant Impact ☐ Less Than Significant with Mitigation ☒ Less Than Significant Impact ☐ No Impact

Discussion f): The project would generate small amounts of solid waste during the construction phase, which could be accommodated by existing area landfills. Operation of the project would not result in an increase of solid waste; therefore, impacts would be less than significant.
g) Comply with federal, state, and local statutes and regulations related to solid waste?

☐ Potentially Significant Impact  ☐ Less Than Significant with Mitigation  ☒ Less Than Significant Impact  ☐ No Impact

Discussion g): Solid waste generated during short-term construction activities, as well as during routine maintenance activities during project operation, would be disposed of in accordance with all federal, state, and local regulations. Therefore, impacts would be less than significant.

18. MANDATORY FINDINGS OF SIGNIFICANCE

a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

☐ Potentially Significant Impact  ☒ Less Than Significant with Mitigation  ☐ Less Than Significant Impact  ☐ No Impact

Discussion a): There is minimal habitat for wildlife species in the project area, and there are no sensitive natural communities. No special-status fish or wildlife species were observed during field surveys, and the likelihood of special-status wildlife species to be in the project area is considered low. With implementation of mitigation measures outlined in Section 4. Biological Resources, impacts on wildlife species would be less than significant. In addition, there are no known archaeological sites within the project area. Although there is potential for cultural resources to be in the project area, with implementation of mitigation measures listed in Section 5. Cultural Resources, impacts on historical and prehistorical resources would be less than significant.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

☐ Potentially Significant Impact  ☐ Less Than Significant with Mitigation  ☒ Less Than Significant Impact  ☐ No Impact
Discussion b): The project area is surrounded primarily by agricultural land uses. A query of the California Office of Planning and Research (OPR) CEQAnet environmental database was conducted for projects dating from November 2014 through November 2015 (OPR, 2015). Based on this research, a list was compiled of recent and future development projects in Amador County (see Appendix C).

As shown in Appendix C, 53 projects are currently or have recently been under environmental review in Amador County. These projects vary from residential, industrial, transportation, habitat restoration, and infrastructure projects in various locations within the county. None of these projects are directly adjacent to the project area. As described in this IS/MND, the project would not have any individually significant impacts that cannot be mitigated to a less than significant level. With compliance with local, state, and federal regulations and implementation of mitigation measures, project impacts would be less than significant. Current and future projects in the project vicinity would be expected to implement similar measures. Therefore, when viewed in connection with other planned projects, the project’s contribution to cumulative impacts would be less than cumulatively considerable and less than significant.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

[ ] Potentially Significant Impact  [ ] Less Than Significant with Mitigation  [x] Less Than Significant Impact  [ ] No Impact

Discussion c): The project would include realigning and improving an intersection and its roadway approaches to improve traffic safety. Traffic flow through the project area could be temporarily affected during project construction. However, the intersection would remain open during construction, and traffic flow would be restored to existing conditions after construction is complete. Construction noise would be minimized through compliance with Caltrans Standard Specifications Section 14-8.02, which requires that noise levels from construction between the hours of 9:00 p.m. and 6:00 a.m. not exceed 86 dBA at a distance of 50 feet from the construction area. The project would not result in substantial adverse effects on human beings; therefore, impacts would be less than significant.

</table>
laying eggs that will hatch and consume the host’s eggs and/or young. Individuals are generally active as adults between May and August. During this time, the adults follow the potential hosts into their burrows to lay their eggs. Dr. Lynn Kimsey, professor of entomology and Director of the Bohart Museum of Entomology at University of California, Davis, was consulted to provide further information on this species (Dr. Lynn S. Kimsey, personal communication, May 18, 2015). Dr. Kimsey confirmed that no host is known for this species, but that other members of the species group attack solitary vespid wasps as their hosts. Because of the Tulare cuckoo wasp’s relatively large body size, Dr. Kimsey estimates that this species would most likely attack ground nesting wasps, or wasps using large beetle burrows in wood. She noted that ground-nesting vespid wasps only build nests in areas of open, sunny soil.

</thead>
<tbody>
<tr>
<td><em>Anaxyrus canorus</em> Yosemite toad</td>
<td>Found in wet mountain meadows, willow thickets, and the borders of forests, usually not more than 100 meters from a permanent water source.</td>
<td>A</td>
</tr>
<tr>
<td><em>Rana boylii</em> Foothill yellow-legged frog</td>
<td>Found in partly shaded, shallow streams, and rilles with a rocky substrate in forests, chaparral, and woodlands. Require some cobble-sized substrate for egg-laying.</td>
<td>A</td>
</tr>
<tr>
<td><em>Rana draytonii</em> California red-legged frog</td>
<td>Found near ponds in humid forests, woodlands, grasslands, coastal scrub, and streams with plant cover. Most common in lowlands or foothills.</td>
<td>A</td>
</tr>
</tbody>
</table>

There is no critical habitat for this species in the BSA. According to the CNDDB, the nearest recorded occurrence of this species was in 1942, approximately 9.4 miles north of the BSA. There are several ponds within one mile of the BSA, and grasslands and oak woodlands in the BSA, which could be used by the CRLF; however, recent intensive surveys have confirmed there are no extant populations of...
the CRLF in Amador County (Barry and Fellers, 2013). The study indicated that only one historical record out of 21 records in the Sierra Nevada contains a persisting population; this extant historical population is located in Placer County. Therefore, this species is not expected to be in the BSA.

### Rana sierrae

**Mountain yellow-legged frog**

- **FE, CH**
- **PX**
- Found in lakes, ponds, meadow streams, isolated pools, and sunny riverbanks in the Sierra Nevada Mountains.

A

There is no habitat, including critical habitat in the BSA; therefore, this species is not expected to be in the BSA.

### Fish

#### Hypomesus transpacificus

**Delta smelt**

- **FT**
- **--**
- Found in the freshwater-saltwater mixing zone of estuaries.

A

There is no habitat in the BSA; therefore, there is no potential for this species to be in the BSA.

#### Oncorhynchus clarki henshawi

**Lahontan cutthroat trout**

- **FT**
- **--**
- Found in cold waters of the Lahontan Basin. Requires gravel riffles in streams for spawning. Cannot tolerate the presence of other salmonids.

A

The BSA is not within the Lahontan Basin; therefore, there is no potential for this species to be in the BSA.

#### Oncorhynchus mykiss irideus

**Central Valley steelhead DPS**

- **FT, CH**
- **--**
- Populations found in the Sacramento and San Joaquin rivers and their tributaries.

A

There is no habitat, including critical habitat, in the BSA; therefore, there is no potential for this species to be in the BSA.

#### Oncorhynchus tshawytscha

**Central valley spring-run Chinook salmon; winter-run Chinook salmon**

- **FT/FE**
- **--**
- Prefer deeper streams than other salmon species. May spend from three months to two years in freshwater before migrating to the ocean to feed and mature.

A

There is no habitat in the BSA; therefore, there is no potential for this species to be in the BSA.

</tbody>
</table>
Table Key: Absent [A] - no habitat present and no further work needed. Habitat Present [HP] - habitat is, or may be present. The species may be present. Present [P] - the species is present. Critical Habitat [CH] - project footprint is located within a designated critical habitat unit, but does not necessarily mean that appropriate habitat is present. Status: Federal Endangered (FE); Federal Threatened (FT); Federal Proposed (FP, FPE, FPT); Federal Candidate (FC), Federal Species of Concern (FSC); State Endangered (SE); State Threatened (ST); Fully Protected (FP); State Rare (SR); State Candidate Threatened (SCT); State Species of Special Concern (SSC); Proposed critical habitat (PX); State No Rank (SNR); California Native Plant Society (CNPS), etc. 1B= Plant species that are rare, threatened, or endangered in California and elsewhere; 2.2= Plant species that are rare, threatened, or endangered in California, but are more common elsewhere; 3.2= Plants about which we need more information; fairly threatened in California.
APPENDIX B: SUMMARY OF AB 52 COORDINATION
September 1, 2015

Melissa Logue
GPA Consulting

Sent by Email: Melissa@gpaconsulting-us.com
Number of Pages: 3

RE: Native American Consultation, Pursuant to Public Resources Code Sections 21080.1, 21080.3.1 and 21080.3.2, Shenandoah/Fiddletown Roads Intersection Improvement project, Amador County

Dear Ms. Logue:

As of July 1, 2015, Public Resources Code Sections 21080.1, 21080.3.1 and 21080.3.2 require public agencies to consult with California Native American tribes identified by the Native American Heritage Commission (NAHC) for the purpose mitigating impacts to tribal cultural resources:

Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section. (Public Resources Code Section 21080.1(d))

The law does not preclude agencies from initiating consultation with the tribes that are culturally and traditionally affiliated with their jurisdictions. The NAHC believes that in fact that this is the best practice to ensure that tribes are consulted commensurate with the intent of the law. Attached is a consultation list of tribes with traditional lands or cultural places located within the boundaries of the potential “area of project affect” (APE).

In accordance with Public Resources Code Section 21080.1(d), formal notification must include a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation. The NAHC believes that agencies should also include with their notification letters information regarding any cultural resources assessment that has been completed on the APE, such as:

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:

   ▪ A listing of any and all known cultural resources have already been recorded on or adjacent to the APE;
   ▪ Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response;
1. If the probability is low, moderate, or high that cultural resources are located in the APE.

2. Whether the records search indicates a low, moderate or high probability that unrecorded cultural resources are located in the potential APE; and

3. If a survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.

2. The results of any archaeological inventory survey that was conducted, including:

   a. Any report that may contain site forms, site significance, and suggested mitigation measurers.

   All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for public disclosure in accordance with Government Code Section 6254.10.

3. A search of the NAHC Sacred Lands File was completed for the APE referenced above. Please note that the absence of specific site information in the Sacred Lands File does not indicate the absence of Native American traditional cultural places or cultural landscapes in any APE. While in this case, a search of the NAHC Sacred Lands File did not indicate the presence of any sites within the APE you provided, a Native American tribe or individual may be the only source for the presence of traditional cultural places. Enclosed is a list of Native American individuals/organizations who may have knowledge of traditional cultural places in your project area. This list should provide a starting place in locating any areas of potential adverse impact.

4. Any ethnographic studies conducted for any area including all or part of the potential APE; and

5. Any geotechnical reports regarding all or part of the potential APE.

Lead agencies should be aware that records maintained by the NAHC and CHRIS is not exhaustive, and a negative response to these searches does not preclude the existence of a cultural place. A tribe may be the only source of information regarding the existence of a tribal cultural resource.

This information will aid tribes in determining whether to request formal consultation. In the case that they do, having the information beforehand well help to facilitate the consultation process.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance we are able to assure that our consultation list contains current information.

If you have any questions, please contact me at dpt_nahc@pacbell.net

Sincerely,

[Signature]

<td>The CDFE has executed Lake and Streambed Alteration Agreement No. 1600-2013-0234-R2, pursuant to section 1602 of the Fish and Game Code to the project Applicant, George W. Reed. The project consists of the installation of a 60 foot long recycled flatcar bridge. The clear-span between concrete abutments will be 46 feet. Steel handrails/guardrails (approximately 120 linear feet total) will be installed on both sides of the bridge. The concrete abutments will be constructed from approximately 60 cubic yards of steel reinforced concrete. The abutments will be placed above the ordinary high water mark and backfilled with clean imported soil. The top of abutment footings will be protected from scour with approximately 70 cubic yards of light facing rip rap. A temporary stream crossing constructed from gravel will be used to access the north bridge abutment construction and driveway fill. The temporary crossing will be removed after construction is complete.</td>

</tbody>
</table>
The project consists of a General Plan Amendment, Rezone, and consolidation and would include individual and multi-year transfers from 2015 through 2024. The transfers could originate in Colusa, Butte, Glenn, Merced, Placer, Sacramento, Shasta, Solano, Sutter, Tehama, Yolo, Or Yuba counties. The transfer buyers could be in Alameda, Contra Costa, Kings, Merced, San Benito, San Joaquin, Santa Clara, or Stanislaus counties.

2011072039 Amador County Newman Ridge Project Notes: Response to Comment The proposed project consists of the following two components: 1) the Newman Ridge Quarry; and 2) the Edwin Center North. The Newman Ridge Quarry is an andesite quarry on approximately 278 acres, with operations occurring on approximately 216 acres. The production level of the Quarry is anticipated to be 5 million tons per year, to be extracted over approximately 50 years, depending on market demand. The Edwin Center North site would host various material processing facilities on approximately 141.37 acres, including an aggregate plant, an asphalt concrete (AC) plant, ready-mix concrete plant, an asphalt and concrete recycling plant, and a rail load out facility for finished products, as well as ancillary administration and support facilities (e.g., fuel storage, truck scales, temporary construction trailer). Mining would not occur within the Edwin Center North, which is geographically separate from the Quarry. The railroad load out facility would be located directly off the existing Union Pacific-Ione Branch rail. The majority of material processed at the Edwin Center would be railed to regional markets, rather than trucked, to the regional market.

Caltrans proposes to implement an Emergency Director's Order to construct rip rap rock slope protection (RSP). The purpose of the project is to prevent further deterioration of the road. This project is needed due to the washout and scour that will undermine the roadway.

The proposed project is the adoption and implementation of the 2015 Amador County Regional Transportation Plan Update (RTP). The RTP contains three primary elements: Policy Element, Action Element, and Financial Element. The RTP is a comprehensive transportation plan for all modes including: highways, local streets and roads, transit, bicycle, rail, and goods movement. The RTP contains policies, actions, and financial strategies for short-term and long-term transportation projects. More detailed information on the RTP can be found at the ACTC website, (www.actc-amador.org).

The County of Amador proposes to adopt an update to the General Plan Housing Element pursuant to Article 10.6, Section 65580 B of California State Law. As required by State law, the proposed Housing Element Update has been prepared to ensure the County accommodates its share of California's projected housing needs. The County has analyzed local housing needs and resources and identified specific sites for potential commercial uses, a 0.60-acre stormwater detention basin, two small water treatment plants, and will not increase the plant capacity. The project is needed due to the washout and scour that will undermine the roadway.

The project consists of a General Plan Amendment, Rezone, and Tentative Subdivision Map for the development of 79 single-family residential lots on 12.2 acres, a 2.72-acre parcel for future development of 41 multi-family residential units, a 1.07-acre parcel for future development of approximately 6,000 sf of commercial uses, a 0.60-acre stormwater detention basin, two open space parcels totaling 0.87 acres, and 3.13 acres of public road right-of-way. The project site will be divided into two villages: Gold Village East and Gold Village West divided by the planned Foothill Boulevard extension.

This project will add facilities to recycle the filter backwash saving 18 million gallons of water annually and adding Aluminum Chlorohydrate for compliance with Disinfection By Product Regulations. The facilities will be located within the existing water treatment plant site and will not increase the plant capacity.

The project involves installing a residential driveway bridge across Rancheria Creek to replace and existing low-water crossing. The crossing will consist of a 60' x 12' prefabricated steel bridge, mounted to 1' wide headwalls on each side of Rancheria Creek. All permanent land disturbances will be located outside of the Ordinary High Water Line. The project site is not located within a Special Flood Hazard Area as delineated on the most recent Flood Insurance Rate Map, dated July 20, 2010.

The Regional Water Board is issuing a 401 Water Quality Certification for the Project. The Project will replace a previously removed boat dock with a new floating, metal boat dock that is of.
